eGRID Technical Guide with Year 2019 Data

Office of Atmospheric Programs
Clean Air Markets Division

eGRID2019

Technical Guide

**Contract # EP-BPA-17-H-0012
Task Order 0-04**

FINAL

February 2021

Prepared for:
Clean Air Markets Division
Office of Atmospheric Programs
U.S. Environmental Protection Agency
Washington, DC 20460

Prepared by:
Abt Associates
6130 Executive Blvd.
Rockville, MD 20852

Notices

This document has been reviewed by the Clean Air Markets Division (CAMD), Office of Atmospheric Programs (OAP), U.S. Environmental Protection Agency (EPA), and approved for distribution.

Acknowledgments

This edition of eGRID was developed under the leadership of Mr. Travis Johnson and Dr. Jeremy Schreifels of EPA's Clean Air Markets Division (CAMD) and Dr. Jonathan Dorn, Ms. Marissa Hoer, Mr. David Cooley, Ms. Kait Siegel, Ms. Hannah Derrick, and Ms. Liz Shenaut of Abt Associates, Inc. The eGRID concept was originated by Mr. Rick Morgan, former EPA Senior Energy Analyst in EPA's Office of Atmospheric Programs, and historical development was led by Mr. Art Diem of EPA's Office of Air Quality Planning and Standards.

[This page intentionally left blank.]

1. Introduction

The Emissions & Generation Resource Integrated Database (eGRID) is a comprehensive source of data on the environmental characteristics of almost all electric power generated in the United States. The preeminent source of emissions data for the electric power sector, eGRID is based on available plant-specific data for all U.S. electricity generating plants that provide power to the electric grid and report data to the U.S. government. Data reported include, but are not limited to, net electric generation; resource mix (for renewable and nonrenewable generation); mass emissions of carbon dioxide (CO₂), nitrogen oxides (NO_x), sulfur dioxide (SO₂), methane (CH₄), nitrous oxide (N₂O), and mercury (Hg); emission rates for CO₂, NO_x, SO₂, CH₄, and N₂O; heat input; and nameplate capacity. eGRID reports this information on an annual basis (as well as by ozone season for NO_x) at different levels of aggregation.

eGRID2019, released in February 2021, is the fourteenth edition of eGRID. eGRID2019 includes two Excel workbooks, one with English units and one with metric units, that contain generator and unit spreadsheets as well as spreadsheets by aggregation level for data year 2019: plant, state, balancing authority, eGRID subregion, NERC region, and United States. The workbooks also include a spreadsheet that displays the grid gross loss and the variables that are used in its estimation for year 2019.

This document provides a description of eGRID2019, including the methodology for developing the Excel spreadsheets for each level of aggregation and the grid gross loss calculation. Section 2 provides a summary of the database; Section 3 presents the methodology for emissions estimations, including adjustments for biomass and combined heat and power (CHP); Section 4 discusses eGRID specific identification codes, name changes and associations; Section 5 describes the data elements in detail; and Section 6 provides a list of references. There is also a set of four Appendices – Appendix A includes the file structure; Appendix B includes the eGRID subregion and NERC region representational maps; Appendix C includes crosswalks between different datasets and relevant data tables; and Appendix D contains information on previous releases of eGRID.

2. Summary of eGRID2019 Data

2.1 eGRID Files

eGRID2019 contains electric power data at different levels of aggregation. The eGRID2019 data are displayed in two workbooks, one with English units of measure and the other with metric units of measure. As the database name implies, the focus of the data spreadsheets is on two areas: generation and emissions. In the English unit workbook, generation is expressed in both MWh and as a percentage (called “resource mix” – generation of a certain fuel or resource type divided by total generation). Carbon dioxide, NO_x, and SO₂ emissions are expressed in short tons; CH₄, N₂O, and Hg emissions are expressed in pounds; emission rates for CO₂, NO_x, SO₂, CH₄, and N₂O are expressed in lb/MWh and lb/MMBtu. In the Metric unit workbook, generation is expressed in MWh, Gigajoules (GJ), and as a percentage. Carbon dioxide, NO_x, and SO₂ emissions are expressed in metric tons; CH₄, N₂O, and Hg emissions are expressed in kilograms; emission rates for CO₂, NO_x, SO₂, CH₄, and N₂O are expressed in both kg/MWh and kg/GJ. See Table C-8 for a list of English to Metric conversion factors.

The eGRID2019 workbooks can be downloaded from the EPA eGRID website, <https://www.epa.gov/egrid>, along with Summary Tables and this document. The workbooks contain eight levels of data aggregation:

- UNIT (unit), with 27,883 records;
- GEN (generator), with 29,154 records;
- PLNT (plant), with 11,865 records;
- ST (state), with 52 records;
- BA (balancing authority), with 76 records;
- SRL (eGRID subregion), with 27 records;
- NRL (NERC region), with 10 records; and
- US, with 1 record.

The unit spreadsheet is sorted by state abbreviation, plant name, plant code, and unit ID. The generator spreadsheet is sorted by state abbreviation, plant name, plant code, and generator ID. The plant spreadsheet is sorted by state abbreviation, plant name, and plant code. The state spreadsheet is sorted by state abbreviation, the balancing authority spreadsheet is sorted by balancing authority name, the eGRID subregion spreadsheet is sorted by eGRID subregion name, and the NERC region spreadsheet is sorted by NERC region acronym. The year 2019 grid gross loss spreadsheet is also included in the workbook.

The spreadsheet structure for each of the spreadsheets is included in Appendix A. The spreadsheet structure also includes a description of the variables and the original data sources.

Users should take note that eGRID’s emissions and emission rates are calculated at the sources of generation and do not account for losses from transmission and distribution infrastructures. Please refer to Section 3.5 for information on how to account for line losses when assigning emission rates to

SUMMARY OF eGRID YEAR 2019 DATA

estimate indirect emissions associated with electricity purchases. Aggregated eGRID data only account for U.S. generation that takes place within the aggregated area and do not account for any electricity that is imported from or exported to other areas. The grid gross loss calculation, however, does account for U.S. regional interchanges with other U.S. regions as well as Canada and Mexico.

In addition, although eGRID is based on existing Federal data sources, its development requires substantial attention to quality control. Accurate matching of entities from different databases requires great care, even where identification codes are available. Inconsistencies between data sources, missing data, and ambiguous data necessitate adjustments to values of individual data elements, especially identification data. In general, however, questionable data are not altered in order to maintain consistency with the original data sources.

Please note that only certain eGRID spreadsheets can be linked from year 2019 to years 2018, 2016, 2014, 2012, 2010, 2009, 2007, 2005, or 2004. The spreadsheets that can be linked include the NERC region (by NERC acronym), eGRID subregion (by eGRID subregion acronym), state (by state abbreviation), plant (by Office of Regulatory Information Systems Plant [ORISPL] code), and the US.

2.2 What's New in eGRID

There are several new data elements or changes to the eGRID methodology in eGRID2019:

- Data from Puerto Rico were added to the Generator, Unit, Plant, State, Balancing Authority, eGRID Subregion, NERC region, and US files. The addition of Puerto Rico resulted in the addition of a new State (Puerto Rico; PR), Balancing Authority (Puerto Rico Miscellaneous; NA), eGRID subregion (Puerto Rico Miscellaneous; PRMS), and NERC region (Puerto Rico; PR) to the eGRID2019 files.
- Added a new CO₂ equivalent combustion output emission rate (lb/MWh) in the Plant, State, Balancing Authority, eGRID Subregion, NERC region, and US files.

2.3 Uses and Users of eGRID

eGRID data support a wide variety of users globally through a wide variety of uses. eGRID is valuable to those in the Federal Government, state and local governments, non-governmental organizations, academia, and companies who are generally seeking environmental information from the electric power sector in the United States. eGRID is most often used for the estimation of indirect emissions from electricity purchases, in greenhouse gas (GHG) inventories, for carbon footprinting, and for estimating avoided emissions from programs and projects that would reduce the consumption for grid supplied electricity. eGRID data are cited by emission inventory and registry protocols, various emission calculation tools and applications, many academic papers, and many consultants, and it is used for many research applications and efforts.

Within EPA, eGRID data are used in the following applications and programs: Power Profiler web application, Climate Leaders protocols, ENERGYSTAR's Portfolio Manager and Target Finder, Waste Wise Office Carbon Footprint Tool, the Personal Greenhouse Gas Emissions Calculator, the Greenhouse Gas Equivalencies Calculator, and the Green Power Equivalency Calculator.

SUMMARY OF eGRID YEAR 2019 DATA

When the EPA announced its “Apps for the Environment” challenge using EPA data, developers across the U.S. responded. EPA announced the winners on November 8, 2011 and the two top winning apps -- Light Bulb Finder (<http://www.lightbulbfinder.net/>) and Hootroot use eGRID data for a mobile app and/or a web app, as did several other entries (EPA, 2011). Another of the winning entries, Joulebug (<http://joulebug.com/>), uses eGRID data and developed a game to save energy as both a web and free iPhone app.

One of the most popular uses of eGRID is to determine the indirect GHG emissions from electricity purchases and avoided GHG emissions from projects and programs that reduce the demand for grid supplied electricity. For example, The Climate Registry, California’s Mandatory GHG emissions reporting program (AB 32), and the Greenhouse Gas Protocol Initiative cite eGRID for use in estimating scope 2 (indirect) GHG emissions from electricity purchases in the United States (TCR, 2019; CARB, 2007; Greenhouse Gas Protocol, 2016). Most carbon footprint calculators that are applicable to the United States use eGRID data.

The website, www.fueleconomy.gov, resulting from an EPA-U.S. Department of Energy (DOE) partnership, provides fuel economy information that consumers can use to make knowledgeable decisions when buying a car. The information can also help consumers achieve the best fuel economy from currently owned cars. This website showcases its Greenhouse Gas Emissions for Electric and Plug-in Hybrid Electric Vehicles calculator, <http://www.fueleconomy.gov/feg/label/calculator.jsp>, which uses eGRID data to estimate the total GHG emissions from electric and plug-in hybrid vehicles, including emissions from electricity used to charge the vehicle. eGRID is cited as a data source at <http://www.fueleconomy.gov/feg/label/calculations-information.shtml>. In a similar vein, the Union of Concerned Scientists published a 2012 report using eGRID data to support its study results that it is advantageous to switch to a battery-powered vehicle, although there are wide differences in both real electricity costs and GHG emissions, depending on the region in which you live (UCS, 2012).

EIA’s National Energy Modeling System (NEMS)’s electricity market module supply regions are the eGRID subregions; the map used in their 2016 documentation (Figure 3) uses the eGRID subregion map and subregion colors, changing a few names (EIA, 2014).

eGRID is also used by other Federal Government agencies such as Oak Ridge National Laboratory (ORNL) for their Combined Heat and Power Calculator, the National Energy Technology Laboratory (NETL) for their sponsored distributed National Carbon Sequestration Database and Geographic Information System (NATCARB), and the National Renewable Energy Laboratory (NREL) for their micropower distributed generation optimization model named HOMER.

States and local governments rely on eGRID data for electricity labeling (environmental disclosure programs), emissions inventories, and registries as well as for efforts to analyze air emissions from the electric power sector. Several states have published state specific emissions information from eGRID or have used eGRID to inform policy decisions. The Maryland Department of the Environment determined eligibility for participation in the Voluntary Renewable Set-Aside Account (VRSA) using eGRID factors (Maryland, 2010); and in 2009, the Delaware Valley Regional Planning Commission (DVRPC) -- a nine county region in Pennsylvania and New Jersey -- completed a 2005 GHG inventory in support of regional efforts to quantify and reduce emissions associated with climate change, using eGRID factors (DVRPC, 2010).

SUMMARY OF eGRID YEAR 2019 DATA

Tracking systems for renewable energy credits (RECs), such as ISO-New England's Generation Information System and PJM Environmental Information Services' Generation Attribute Tracking System utilize eGRID data.

ISO New England used eGRID rates in developing the 2017 New England Electric Generator Air Emissions Report (<http://www.iso-ne.com/system-planning/system-plans-studies/emissions>).

eGRID is additionally used for nongovernmental organizations' (NGOs) tools and analysis. The following is a list of some known users and applications of eGRID data: Northeast States for Coordinated Air Use Management (NESCAUM) analysis; Powerscorecard.org; Ozone Transport Commission (OTC)'s Emission Workbook; GHG Protocol Initiative; Rocky Mountain Institute's Community Energy Finder; Leonardo Academy's Cleaner and Greener Environmental Program; National Resource Defense Council's Benchmarking Air Emissions; Berkeley Institute of the Environment; Cool Climate Carbon Footprint Calculator; Climate and Air Pollution Planning Assistant; Emission Solution's Carbon Footprint Calculator; International Council for Local Environmental Initiatives' Clean Air software, United States Department of Transportation Federal Transit Administration, Google PowerMeter; National Public Radio's Visualizing the U.S. Electric Grid; International Code Council; American Society of Heating, Refrigerating, and Air-Conditioning Engineers; American Council for an Energy-Efficient Economy's Local Energy Efficiency Policy Calculator; and World Resource Institute's Carbon Value Analysis Tool.

Carbon Visuals, which illustrate accurate volumetric images to visualize the carbon footprint of all U.S. power stations, used eGRID subregion GHG emission factors (<http://www.carbonvisuals.com/projects/2015/6/23/visualising-the-carbon-footprint-of-all-us-power-stations?rq=egrid>; Carbon Visuals, 2014).

The University of California, Berkeley's CoolClimate Carbon Footprint Maps use eGRID data (Jones and Kammen, 2013).

Several papers have been written to clarify issues and respond to questions about the uses of eGRID. The following provides details on some of the most recent presentations and papers.

- In January 20201, "Using eGRID for Environmental Footprinting of Electricity Purchases," (Huetteman et al., 2021) was published on the EPA website.
- In October 2019, "EPA's 2018 Emissions & Generation Resource Integrated Database (eGRID): Updates and Improvements," (Dorn et al., 2019a) was presented at the 18th Annual Community Modeling and Analysis System Conference.
- In August 2019, "Adding Particulate Matter to EPA's eGRID Database," (Dorn et al., 2019b) was presented at EPA's 2019 International Emissions Inventory Conference.
- In June 2019, "Adding Particulate Matter to EPA's eGRID Database," (Hoer et al., 2019) was presented at the Air and Waste Management Association's 112th Annual Conference & Exhibition.
- In October 2018, "EPA's Emissions & Generation Resource Integrated Database (eGRID): Improvements and Applications" (Cooley et al., 2019) was presented at the 17th Annual Community Modeling and Analysis System Conference.

SUMMARY OF eGRID YEAR 2019 DATA

- In May 2016, “How Part 75 Data is Used in GHG Reporting and EE/RE Quantification,” (Johnson, 2016a) was presented at the EPRI Continuous Emissions Monitoring User Group Conference.
- In February 2016, “Emissions & Generation Resource integrated Database (eGRID),” (Johnson, 2016b) was presented at the Energy, Utility, and Environment Conference.
- In October 2015, “EPA’s Emissions & Generation Resource Integrated Database (eGRID): Improvements and Applications: (Dorn et al., 2015) was presented at the Community Modeling and Analysis System Conference.
- In February 2015, “eGRID Updates,” (Johnson, Schreifels, and Quiroz, 2015) was presented at the Energy, Utility, and Environment Conference.
- The paper “Using EPA’s eGRID to Estimate GHG Emissions Reductions from Energy Efficiency” (Diem, Salhotra, and Quiroz, 2013) was presented at the International Energy Program Evaluation Conference, in August 2013.
- In January 2013, “Using eGRID Data for Carbon Footprinting Electricity Purchases,” (Diem and Quiroz, 2013) was presented at the Energy, Utility, and Environment Conference.
- The paper “How to use eGRID for Carbon Footprinting Electricity Purchases in Greenhouse Gas Emission Inventories” (Diem and Quiroz, 2012) was presented at the EPA 2012 International Emission Inventory Conference in August 2012.

2.4 eGRID Data Sources

eGRID is developed using the following key data sources:

- CAMD’s Power Sector Emissions Data (EPA/CAMD): this includes data reported to EPA by electric generating units to comply with the regulations in 40 CFR Part 75 and 40 CFR Part 63. Data include annual emissions of CO₂, NO_x, SO₂, and Hg; ozone season emissions of NO_x; and annual and ozone season generation and heat input. The data are available at <https://www.epa.gov/airmarkets/power-sector-emissions-data>. CAMD’s Power Sector Emissions Data used in eGRID2019 was queried on October 5, 2020.
- EIA-860: this includes data reported to EIA on electric generators. Data include nameplate capacity, prime mover, primary fuel type, and indication of whether the generator is a combined-heat-and-power unit (EIA, 2020a). The EIA-860 data used in eGRID2019 was released on September 15, 2020. Generators from Puerto Rico were included in the EIA-860 monthly reports. The EIA-860 monthly data used in eGRID2019 was released in January 2020 and downloaded on December 11, 2020 (EIA, 2020b).
- EIA-923: this includes data reported to EIA on fuel consumption and generation. Data include monthly generation and heat input at the unit or generator level for a subset of units and generators, and at the prime mover level for all plants. As discussed in more detail below, eGRID2019 uses unit- or generator-level data where available, and prime mover-level data for all other units and generators (EIA, 2020c). The EIA-923 data used in eGRID2019 was released on September 22, 2020.

SUMMARY OF eGRID YEAR 2019 DATA

The key identifier of plants in CAMD's Power Sector Emissions Data and EIA datasets is the ORISPL code. While the ORISPL code generally matches well for plants in the different datasets, there are some plants that have different ORISPL codes between CAMD's Power Sector Emissions Data and EIA data. These plants are listed in Appendix C.

3. eGRID Methodology

This section describes the methodologies utilized to develop eGRID2019. Some methods used for eGRID2019 are modified or refined from previous editions of eGRID, and are so noted in this section. Also see Section 2.2 for a list of changes to eGRID2019.

3.1 Estimation of Emissions

The Unit file and Plant file in eGRID2019 include emissions data for CO₂, NO_x, SO₂, CH₄, and N₂O, and the Unit file includes Hg emissions.¹ Carbon dioxide (CO₂) is a product of combusting fossil fuels, as well as biogenic and other materials, and is the primary greenhouse gas (GHG) emitted by human activities that is driving global climate change; nitrogen oxides (NO_x) are also emitted by electric generating units and are precursors to the formation of ozone, or smog, and fine particulates (PM_{2.5}), and also contributes to acid rain and other environmental and human health impacts; sulfur dioxide (SO₂) is emitted by electric generating units, especially with coal combustion, and is a precursor to acid rain and PM_{2.5} and is associated with other environmental and human health impacts. Methane (CH₄) and nitrous oxide (N₂O), two other GHGs emitted by electric generating units, have been included in eGRID since data year 2005 at the plant level. The eGRID emissions data for the three GHGs are used as default factors in a variety of climate protocols (including The Climate Registry, California’s Mandatory GHG emissions reporting program (AB 32), and EPA’s Climate Leaders) for indirect emissions estimation calculations (TCR, 2019; CARB, 2007; EPA, 2019).

Emissions estimates are included at the unit level, in the Unit file, as well as summed to the plant level, in the Plant file. The sum of unit level emissions from the Unit file will equal the unadjusted plant level emissions in the Plant file, apart from Hg emissions.

Plant level emissions in eGRID reflect a combination of monitored and estimated data. Emissions and emission rates in eGRID represent emissions and rates at the point(s) of generation. While they do account for losses within the generating plants (net generation), they do not take into account any power purchases, imports, or exports of electricity into a specific state or any other grouping of plants, and they do not account for any transmission and distribution losses between the points of generation and the points of consumption. Also, eGRID does not account for any pre-combustion emissions associated with the extraction, processing, and transportation of fuels and other materials used at the plants or any emissions associated with the construction of the plants.

eGRID emissions and heat input that are displayed in the Unit file are unadjusted, while the Plant file contains emissions and heat input that are adjusted for biomass and/or CHP units, where applicable. The Plant file also contains unadjusted emissions. The subsequent aggregation files are based on adjusted emissions. All emission rates in the Plant file and all aggregation files are based on adjusted

¹ The Plant file also contain fields for emissions of mercury. However, while electric generating units started to report mercury data to CAMD’s Power Sector Emissions Data in 2015, the data are incomplete. We have included the unit-level emissions, but since only a subset of the units at one plant may list mercury emissions, we have not summed these emissions to the plant-level. Therefore, we have retained these fields in anticipation of being able to report plant-level mercury emissions and emission rates in a future edition of eGRID.

SPECIFIC eGRID IDENTIFIER CODES, NAME CHANGES AND ASSOCIATIONS

emissions, net generation, and adjusted heat input. Both the source(s) of emissions data and adjustment flags are provided in the Plant file.

3.1.1 Unit Level and Plant Level Unadjusted Emission Estimates

3.1.1.1 Annual Emission Estimates for CO₂, NO_x, and SO₂

Unit File

Unit level emissions in the eGRID Unit file are estimated in a three-step process:

1. We include unit-level emissions and heat input data from CAMD's Power Sector Emissions Data;
2. For units that report to EIA at the unit level but not to CAMD's Power Sector Emissions Data, we include the reported unit-level heat input from EIA; and
3. For all other units that report EIA at the plant level, we distribute prime mover-level heat input to each unit based on that unit's proportion of nameplate capacity.

For units that report to EIA but not to CAMD's Power Sector Emissions Data (steps 2 and 3), we estimate emissions by multiplying the heat input by the fuel-specific emission factors shown in Appendix C.

Generally, emission sources that are included in CAMD's Power Sector Emissions Data are fossil fuel-fired boilers and turbines serving an electric generator with a nameplate capacity greater than 25 MW and producing electricity for sale. Additionally, some sources not serving a generator or serving a generator less than 25 MW also report to CAMD's Power Sector Emissions Data.

For units that are included in CAMD's Power Sector Emissions Data only during the ozone season, the non-ozone season heat input is taken from the EIA-923. The non-ozone season heat input for each included unit was distributed from the prime-mover level based on the nameplate capacity of that unit (step 3 above). The EIA-923 distributed non-ozone season heat input is added to the ozone season heat input from CAMD's Power Sector Emissions Data. Non-ozone season emissions for NO_x are calculated and added to the reported CAMD's Power Sector Emissions Data ozone season NO_x emissions. The emissions for CO₂ and SO₂ for these units are calculated using the methodology discussed below, using the updated heat input. The heat input and emission adjustment only applies to 167 units out of the total 247 units in CAMD's Power Sector Emissions Data that reported only during the ozone season. There are 80 units that cannot be updated to reflect annual data values due to differences for these units in CAMD's Power Sector Emissions Data and EIA data.

CO₂

As discussed above, the majority of CO₂ emissions reported in eGRID2019 are monitored data from CAMD's Power Sector Emissions Data. For units that report to EIA but not to CAMD's Power Sector Emissions Data, or for units from CAMD's Power Sector Emissions Data where there are gaps in CO₂ emissions data, the CO₂ emissions are estimated based on heat input and an emission factor.

The emission factors are primarily from the default CO₂ emission factors from the EPA Mandatory Reporting of Greenhouse Gases Final Rule (EPA, 2009, Table C-1). For fuel types that are included in eGRID2019 but are not in the EPA Mandatory Reporting of Greenhouse Gases Final Rule, additional emission factors are used from the 2006 Intergovernmental Panel on Climate Change

SPECIFIC eGRID IDENTIFIER CODES, NAME CHANGES AND ASSOCIATIONS

(IPCC) Guidelines for National Greenhouse Gas Inventories and the EPA Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990-2015 (IPCC, 2007a; EPA, 2017).

Several fuel types do not have direct reported emission factors, so emission factors from similar fuel types are used:

- The emission factor for natural gas is used to estimate emissions from process gas and other gas;
- The emission factor for anthracite, bituminous, and lignite coal are used to estimate emissions from refined coal and waste coal; and
- The emission factor for other biomass liquids is used to estimate emissions from sludge waste and liquid wood waste.

The CO₂ emissions from hydrogen, nuclear, purchased steam, solar, waste heat, water, wind, and energy storage are considered to be zero. The CO₂ emissions for units with a fuel cell prime mover are also assumed to be zero.

A list of the CO₂ emission factors used in eGRID2019 can be found in Table C-1 in Appendix C.

NO_x

Similar to CO₂, the emissions from NO_x come from monitored data from CAMD's Power Sector Emissions Data where available.

For all other units, the NO_x emissions are based on heat input multiplied by an emission factor. For some units, EIA reports unit-level NO_x emission rates (lb/MMBtu) for both annual and ozone season emissions, from EIA Form 923, Schedule 8C. These unit-level emissions rates are multiplied by the unit-level heat input used to estimate annual and ozone season NO_x emissions. For all other units that report to EIA but are not included in CAMD's Power Sector Emissions Data, the unit-level heat input is multiplied by a prime mover- and fuel-specific emission factor from EPA's AP-42 Compilation of Air Pollutant Emission Factors or the EIA Electric Power Annual (EPA, 1995; EIA, 2020f, Table A-2).

Ozone season NO_x emissions include emissions from May through September. For units where the NO_x emissions are estimated with an emission factor, the NO_x ozone season emissions are based on the emission factor multiplied by the heat input for May through September.

See Table C-2 in Appendix C for the NO_x emission factors used in eGRID2019.

SO₂

As with the other pollutants, emissions of SO₂ are taken from monitored data from CAMD's Power Sector Emissions Data where available.

For all other units, SO₂ emissions are based on heat input multiplied by an emission factor. Unlike for NO_x, EIA does not report unit-level emissions rates for SO₂. Therefore, the SO₂ emissions for all units not included in CAMD's Power Sector Emissions Data are estimated using emission factors from EPA's AP-42 or the EIA Electric Power Annual, which are specific to fuel, prime mover, and in the case of boilers, boiler type (EPA 1995; EIA, 2020f, Table A-1).

SPECIFIC eGRID IDENTIFIER CODES, NAME CHANGES AND ASSOCIATIONS

For some fuels, such as coal and oil, the emission factor from AP-42 depends on the sulfur content of the fuel. For many units, EIA reports monthly unit-level data on the sulfur content of the fuel consumed, and these data are used with the AP-42 emission factors to estimate SO₂ emissions. For units without unit-level data on the sulfur content of fuels, the sulfur content is based on an average of the reported sulfur contents for units that have the same prime mover and fuel type.

For some units for which we calculated SO₂ emissions with an emission factor, EIA reports SO₂ control efficiencies. For these units the estimated SO₂ emissions are multiplied by (1 – control efficiency) to estimate the controlled emissions. Units that do not have unit-level control efficiency data are assumed to be uncontrolled. The control efficiencies are not used for units where the emissions data are from CAMD's Power Sector Emissions Data, because these emissions already take controls into account.

See Table C-3 in Appendix C for the SO₂ emission factors used in eGRID2019.

Geothermal

Geothermal emissions are estimated for CO₂, SO₂, and NO_x. While CO₂ is a gas in the geothermal reservoir, SO₂ and NO_x result from hydrogen sulfide combustion. The three pollutants' emission factors, obtained from a 2007 Geothermal Energy Association environmental guide (GEA, 2007), are applied to plant net generation, and differ depending on the type of geothermal plant as identified in various reports from the Geothermal Energy Association (GEA, 2016). For a binary or flash/binary geothermal plant, there are no CO₂, SO₂, or NO_x emissions since the plant operates a closed system; for a flash geothermal plant, there are no NO_x emissions and minimal CO₂ and SO₂ emissions; and for a dry steam geothermal plant, there are minimal CO₂, SO₂, and NO_x emissions.

See Table C-7 in Appendix C for the geothermal emission factors used in eGRID2019.

Plant File

The emissions of CO₂, NO_x, and SO₂ in the Plant file are the sum of all unit-level emissions at a plant from the Unit file.

3.1.1.2 Annual Emission Estimates for CH₄, N₂O, and CO₂ equivalent

Emissions for CH₄, N₂O, and CO₂-equivalent (CO₂e) are included in eGRID2019 at the plant level.²

The emissions for CH₄ and N₂O are calculated using heat input data and emission factors from the EPA or the IPCC. The emission factors are primarily from the EPA Mandatory Reporting of Greenhouse Gases Final Rule (EPA, 2009, Table C-1). For fuel types that are included in eGRID2019 but not in Table C-1 of the EPA Mandatory Reporting of Greenhouse Gases Final Rule, additional emission factors are used from the 2006 IPCC Guidelines for National Greenhouse Gas Inventories and the EPA Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990-2015 (IPCC, 2007a; EPA, 2017).

² Nitrous oxide is an oxide of nitrogen that is not part of the NO_x subset of oxides of nitrogen. N₂O is a greenhouse gas, the emissions of which are contributing to global climate change. N₂O should not be confused with NO_x.

SPECIFIC eGRID IDENTIFIER CODES, NAME CHANGES AND ASSOCIATIONS

Several fuel types do not have direct reported emission factors, so emission factors from similar fuel types are used:

- The emission factor for natural gas is used to estimate emissions from process gas and other gas;
- The emission factor for anthracite, bituminous, and lignite coal are used to estimate emissions from refined coal and waste coal; and
- The emission factor for other biomass liquids is used to estimate emissions from sludge waste and liquid wood waste.

The CH₄ and N₂O emissions for electricity used from energy storage (megawatt-hours), hydrogen, nuclear, purchased steam, solar, waste heat, water, and wind are considered to be zero. The CH₄ and N₂O emissions from units with a fuel cell prime mover are also considered to be zero.

A list of the CH₄ and N₂O emission factors used in eGRID2019 can be found in Table C-1 in Appendix C.

The CO₂ equivalent (CO₂e) emissions, in tons, and total output emission rate (lb/MWh) are included in the Plant file and subsequent aggregation files. The CO₂e nonbaseload output emission rate (in lb/MWh) is included at the aggregated State, BA, NERC region, eGRID subregion, and US level in the eGRID file. CO₂e emissions are calculated based on the global warming potential of CO₂, CH₄, and N₂O.

Global warming potential is a value assigned to a GHG so that the emissions of different gases can be assessed on an equivalent basis to the emissions of the reference gas, CO₂. Traditionally, the 100-year GWPs are used when calculating overall CO₂ equivalent emissions, which is the sum of the products of each GHG emission value and their GWP. Based on the fourth IPCC assessment (2007) (AR4), the GWP of CO₂ is 1, CH₄ is 25 and N₂O is 298. When calculating the CO₂ equivalent, it is important to ensure that each of the GHG emission values has the same measurement units (i.e. either all in short tons or all in pounds), as CO₂ emissions are expressed in short tons while both CH₄ and N₂O emissions are expressed in pounds in eGRID. The GWPs were updated to AR4 in eGRID2018 to align with other EPA sources reporting CO₂ equivalent emissions. Previous versions of eGRID used the second IPCC assessment (SAR). A comparison of the GWPs for CO₂, CH₄, and N₂O is shown in Table 3-1 (EPA, 2017, Table 1-3; IPCC, 2007b, Table 3).

Table 3-1. Comparison of 100-Year GWPs

Gas	SAR	TAR	AR4	AR5*
CO ₂	1	1	1	1
CH ₄	21	23	25	34
N ₂ O	310	296	298	298

*Note that the AR5 values include climate-carbon feedbacks

3.1.1.3 Annual Emission Estimates for Mercury

Mercury emissions are reported to CAMD's Power Sector Emissions Data at the unit-level and are directly incorporated into the eGRID Unit file.

SPECIFIC eGRID IDENTIFIER CODES, NAME CHANGES AND ASSOCIATIONS

Mercury emissions are not summed to the Plant file since the unit-level data may not be available for all units at a plant. While electric generating units started to report mercury data to CAMD's Power Sector Emissions Data in 2015 under the Mercury and Air Toxics Standards (MATS), the data are incomplete. The unit-level emissions are included in the Unit file, but since only a portion of the units at one plant may not list mercury emissions, they have not summed these emissions to the plant-level. However, the fields for Hg emissions and emissions rates in the Plant file have been retained so that these data may be included in future editions of eGRID.

3.1.2 Plant Level Adjusted Emission Estimates

Emissions reported in eGRID represent emissions from fuel utilized only for electricity generation. For certain plants, there are two possible cases for which we adjust the emission estimates: (1) if the plant is a CHP facility; and (2) if one or more units at the plant burn biomass, including biogas (such as landfill, methane, and digester gas). The Plant file reports both adjusted and unadjusted emissions, while the Unit file reports only unadjusted emissions. Due to these adjustments, the adjusted emissions reported in eGRID may be different from emissions reported in other EPA sources.

3.1.2.1 Adjustments for Biomass

Prior editions of eGRID applied a biomass adjustment to the annual emission values based on an assumption of zero emissions from biomass combustion. This assumes that the amount of carbon sequestered during biomass growth equals the amount released during combustion, without consideration of other factors. For reasons of consistency, the same approach is applied in eGRID2019.

eGRID makes adjustments for biogas emissions, for biomass emissions other than biogas, and for solid waste emissions for specified pollutants. Solid waste typically consists of a mixture of biogenic materials—such as wood, paper, and food waste—and fossil-based materials—such as plastics and tires. EIA-923 reports fuel consumption at plants that combust municipal solid waste (MSW) as the biomass component (MSB) and the non-biomass component (MSN). Emissions from the biomass component of solid waste are adjusted, while emissions from the non-biomass component of solid waste are not adjusted. In eGRID2019, the fuel type for these plants is listed as MSW.³

The Plant file includes a biomass adjustment flag to indicate whether a biomass adjustment is made to the annual emission values for CO₂, NO_x, SO₂, CH₄, and N₂O. The possible biomass adjustments to emissions are explained below. See Table C-1 in Appendix C for a table of biomass fuel types used in the biomass adjustments to emissions in the Plant file.

For plants that have a biomass adjustment, the amount of emissions that the total emissions are adjusted by are included in eGRID2019. The emissions adjustment values from CO₂ are listed for all plants with a biomass flag and the emissions adjustment values from NO_x, SO₂, CH₄, and N₂O are listed for plants with a biomass flag with landfill gas. Table A-3 in Appendix A has a list of all the new fields added to the Plant file, including the biomass emissions adjustment values. Note that for plants that have both a biomass flag and a CHP flag, the biomass emissions adjustment value subtracted from the unadjusted emissions value will not match the adjusted emissions value. For these

³ Previous editions of eGRID estimated the split between the biomass and non-biomass components of MSW. Because the EIA-923 reports these components separately, this estimation is no longer necessary.

SPECIFIC eGRID IDENTIFIER CODES, NAME CHANGES AND ASSOCIATIONS

plants, the CHP adjustment value needs to be accounted for as well. See Section 3.1.2.3 below for a sample calculation of a plant with both a biomass and CHP adjustment.

CO₂

The emissions from biomass combustion at a plant are subtracted from the plant's overall unadjusted CO₂ emissions. The CO₂ emissions from biomass are reported at the plant level. To determine the biomass emissions if the CHP adjustment is also flagged, the adjusted emissions value from CHP plants must first be calculated (since the CHP plant adjustment is applied last; see Section 3.1.2.2 below).

For CAMD's Power Sector Emissions Data units with a prime mover that matches EIA-923 prime movers that burn one or more biomass fuels, the CO₂ emissions are adjusted by subtracting the biomass CO₂ emissions calculated using the corresponding EIA-923 data (EIA, 2020c). In previous editions of eGRID, there were different flags for the biomass adjustment to represent different biomass fuels or differences in the emissions data source.

NO_x, SO₂, CH₄, and N₂O

Emissions adjustments for NO_x, SO₂, CH₄, and N₂O emissions are only conducted for landfill gas in eGRID. This adjustment is based on the assumption that in many cases landfills would flare the gas if they did not combust it for electricity generation. Therefore, we assume that, at a minimum, the gas would have been combusted in a flare and would have produced some emissions of NO_x, SO₂, CH₄, and N₂O anyway. Similar to the CO₂ adjustments, biogas adjustments are made by deducting the emissions from landfill gas for NO_x, SO₂, CH₄, and N₂O from the overall plant total emissions. For NO_x emissions from landfill gas, an emission factor for flaring of landfill gas, 0.02 tons per MMBtu, is used (EPA, 1995).⁴ See Table C-1 in Appendix C for a list of CH₄, and N₂O emission factors and the landfill gas (LFG) values from Table C-3 for a list of SO₂ emission factors. Note that CO₂ is also adjusted for landfill gas, as described above.

3.1.2.2 Adjustments for CHP

A CHP facility is a type of generating facility that produces electricity and another form of useful thermal energy (such as heat or steam) used for industrial, commercial, heating, or cooling purposes. CHP, also known as cogeneration, can convert energy more efficiently than facilities that separately produce heat and electricity. Plants in eGRID are designated as CHP facilities based on information from the EIA-860, EIA-923, and Department of Energy Combined Heat and Power Database datasets (EIA, 2020c; DOE, 2018). A flag indicating whether or not a plant is a CHP facility is included in the eGRID Plant file. Since emissions reported in eGRID represent electricity generation only, emissions associated with useful thermal output—the amount of heat produced in a CHP facility that is used for purposes other than making electricity—are excluded from the adjusted emissions.

eGRID's CHP adjustment methodology is designed to allocate emissions for CHP plants between electricity and thermal output. If a plant is a CHP facility, the adjustment is applied to the emissions and heat input for the entire plant after any biomass adjustment has been made.

⁴ Note that this factor was converted from units of lb/standard cubic foot (scf) to tons/MMBtu based on a value of 500 Btu/scf (EPA, 2016).

SPECIFIC eGRID IDENTIFIER CODES, NAME CHANGES AND ASSOCIATIONS

The methodology is based on multiplying emissions and heat input by an electric allocation factor, which is calculated as follows:

1. Calculate the useful thermal output. EIA-923 reports both total fuel consumption and fuel consumption for electricity generation.⁵ The useful thermal output value for eGRID2019 data is calculated from EIA-923 data as 0.8 multiplied by the difference in total heat input and electricity heat input in MMBtu. The value of 0.8 is an assumed efficiency factor from the combustion of the consumed fuel (EIA, 2020c).

$$\text{Useful Thermal Output} = 0.8 \times (\text{Total Heat Input} - \text{Electric Heat Input})$$

2. The electric allocation factor is calculated as the ratio of the electricity heat output to the sum of the electricity and steam heat outputs, where electricity heat output is the net generation in MWh multiplied by 3.413 to convert it to MMBtu, and steam heat output is 0.75 multiplied by the useful thermal output, in MMBtu. The 0.75 factor is another assumed efficiency factor, which accounts for the fact that once fuel is combusted for electricity generation, approximately 75 percent of the useful thermal output can be utilized for other purposes, such as space heating or industrial processes.⁶

$$\text{Electric Allocation Factor} = \frac{3.413 \times \text{Net Generation}}{(0.75 \times \text{Useful Thermal Output}) + (3.413 \times \text{Net Generation})}$$

If the useful thermal output is zero, then the electric allocation factor is set to one. The electric allocation factor should be between zero and one. If the electric allocation factor is calculated to be greater than one, it is set to one, and if the electric allocation factor is calculated to be less than zero, it is set to zero.

In previous editions of eGRID, the CHP adjustment methodology involved a process for estimating the electric allocation factor in cases where a unit is listed as a CHP unit, but the total heat input and electric heat input reported by EIA were reported as equal. In discussions with EIA, we have determined that in these cases, there should be no CHP adjustment made. Therefore, for units listed as CHP units, but with a total heat input equal to the electric heat input, the useful thermal output is calculated to be 0, and the electric allocation factor is set to 1. This assumes that all of the heat input for these units is used for electricity generation and that useful thermal output is not produced.

For plants that have a CHP adjustment, the amount of heat input and emissions that the total emissions are adjusted by are included in eGRID2019. The emissions adjustment values from heat input, NO_x, SO₂, CO₂, CH₄, and N₂O are listed for plants with a CHP flag. Table A-3 in Appendix A has a list of all the new fields added to the Plant file, including the CHP heat input and emissions

⁵ CHP facilities do not report these values to EIA separately. They only report total fuel consumption, and EIA estimates the fuel consumption for electricity generation.

⁶ This assumes that the CHP units generate electricity first and use the waste heat for other purposes, also known as “topping.” While there are some units that generate and use heat first and then use the waste heat to generate electricity, also known as “bottoming,” data from the EIA shows that the vast majority of CHP facilities are topping facilities.

SPECIFIC eGRID IDENTIFIER CODES, NAME CHANGES AND ASSOCIATIONS

adjustment values. Note that for plants that have both a biomass flag and a CHP flag, the unadjusted emissions multiplied by the electric allocation factor will not match the adjusted emissions value. For these plants, the biomass adjustment value needs to be accounted for as well. See Section 3.1.2.3 below for a sample calculation of a plant with both a biomass and CHP adjustment.

3.1.2.3 Plant-level adjustment example calculation

There are several plants that have both a biomass adjustment and a CHP adjustment. The following calculation steps are used to determine the final presented CO₂ adjusted emission values.

1. The biomass emissions are determined in accordance with section 3.1.2.1 and removed from the plant unadjusted annual CO₂ emissions.

$$UNCO2 - BIOCO2 = PLCO2_{bio\ removed}$$

Where;

UNCO2 = plant unadjusted annual CO₂ emissions
BIOCO2 = plant annual CO₂ biomass emissions
PLCO2_{bio removed} = plant annual CO₂ emissions without biomass (intermediate value)

2. The electric allocation factor is determined in accordance with section 3.1.2.2 and the CHP adjustment is then conducted by multiplying the biomass adjusted plant emissions by the electric allocation factor.

$$PLCO2_{bio\ removed} \times ELALLOC = PLCO2AN$$

Where;

PLCO2_{bio removed} = plant annual CO₂ emissions without biomass (intermediate value)
ELALLOC = electric allocation factor (see section 3.1.2.2)
PLCO2AN = plant annual CO₂ emissions (biomass and CHP adjusted)

3. The amount of CHP adjusted emissions are determined by subtracting the final adjusted plant emissions from the plant annual CO₂ biomass emissions.

$$PLCO2_{bio\ removed} - PLCO2AN = CHPCO2$$

Where;

PLCO2_{bio removed} = plant annual CO₂ emissions without biomass (intermediate value)
PLCO2AN = plant annual CO₂ emissions (biomass and CHP adjusted)
CHPCO2 = plant annual CO₂ emissions CHP adjustment value

Table 3-2 and the following equations show an example calculation of how the adjustments are done together.

Table 3-2. Example Biomass and CHP CO₂ Emissions Adjustment Calculation

Plant Name	Fuel	ELALLOC	UNCO2 (tons)	BIOCO2 (tons)	CHPCO2 (tons)	PLCO2AN (tons)
Example Plant	OBG	0.1989	75,817	65,289	8,434	2,094

SPECIFIC eGRID IDENTIFIER CODES, NAME CHANGES AND ASSOCIATIONS

1. $75,817 \text{ tons} - 62,289 \text{ tons} = 10,528 \text{ tons}$
2. $10,528 \text{ tons} \times 0.1989 = 2,094 \text{ tons}$
3. $10,528 \text{ tons} - 2,094 \text{ tons} = 8,434 \text{ tons}$

3.1.3 Emission Rate Estimates

Input and output emission rates are calculated for eGRID at the plant level in the Plant file, and the subsequent aggregated files. Annual and ozone season net generation and heat input values (adjusted for CHP plants) are required to calculate the emission rates.

3.1.3.1 Generation

Net generation, in MWh, is the amount of electricity produced by the generator and transmitted to the electric grid. Net generation does not include any generation consumed by the plant. If generation consumed by the plant exceeds the gross generation of that plant, negative net generation will result. In these cases, the output emissions rates are set to 0, rather than report a negative emissions rate.

Generator-level net generation as well as prime mover-level net generation is obtained from the EIA-923. Ozone season generation is calculated by summing up the generation for the months of the ozone season, May through September (EIA, 2020c).

The methodologies employed for obtaining year 2019 net generation data are described below.

Generator-Level Net Generation

The EIA-923 dataset reports generator-level generation for a subset of generators. This generator-level generation is reported in the Generator File in eGRID2019. For all other generators, which do not have data on generator-level generation, prime mover-level net generation is distributed to the generators in the Generator file based on the proportion of nameplate capacity of generators with that prime mover at a given plant. Ozone season net generation uses the same methodology, but only includes generation data for May to September. Annual and ozone season generation is distributed to generators with a status of operating, standby/backup, out of service but was operating for part of the data year, or retired if the retirement year is 2019. Generation is not distributed to generators if the generator is not yet in operation or retired before 2019.

In some cases the sum of the generator-level generation does not equal the plant-level generation, even if all generator-level generation is available for all generators. In order to ensure that the generation in eGRID matches the plant-level generation data from EIA, distributed prime mover-level data are used in some cases in place of generator-level generation data.

As explained above, some generator-level net generation data are missing or not reported for various generators in the 2019 EIA-923. EIA aggregates these missing data to the state level by fuel type, but it is not possible to distribute them back to the generator level accurately (EIA, 2020c).

Plant-Level Net Generation

The annual generation data in the Plant file are the sum of all generator-level generation at the plant from the Generator file. The ozone season generation data in the Plant file are a sum of all ozone season (May-September) generator-level generation at the plant from the Generator file.

SPECIFIC eGRID IDENTIFIER CODES, NAME CHANGES AND ASSOCIATIONS

Combustion net generation is also developed (as is non-combustion generation) based on the fuel type generation of each plant. For plants that are only composed of combustion generating units, the plant combustion net generation is the same as the total plant net generation. For plants that have both combustion and non-combustion generating units, the combustion net generation will be less than the total net generation for that plant.

3.1.3.2 Heat Input

Heat input, in MMBtu, is the amount of heat energy consumed by a generating unit that combusts fuel. The method for assigning unit-level heat input follows the same process as the method for assigning unit-level CO₂ emissions (see section 3.1.1.1). Annual and ozone season unit-level heat input for eGRID is initially obtained from the reported emissions data from CAMD's Power Sector Emissions Data. The heat input from CAMD's Power Sector Emissions Data is based either on stack flow and CO₂/O₂ monitoring or fuel flow and the heat content of fuel.

If unit level heat input data from CAMD's Power Sector Emissions Data are not reported or the overall plant is not included in CAMD's Power Sector Emissions Data, annual and ozone heat input data are obtained at the unit level or prime mover level from the EIA-923 monthly data (EIA, 2020c). For units that only report ozone season heat input to CAMD's Power Sector Emissions Data, a methodology is used to add the additional heat input for non-ozone season months from the EIA-923 (see discussion in Section 3.1.1.1).

The Unit file unit level heat input is summed to the plant level and reported in the Plant file.

3.1.3.3 Emission Rates

Output, input, and combustion emission rates are reported in the Plant, State, Balancing Authority, eGRID Subregion, NERC Region, and US eGRID files. The fuel-based and nonbaseload emission rates are reported in the State, Balancing Authority, eGRID Subregion, NERC Region, and US eGRID files.

Output and Input Emission Rates

Output emission rates for SO₂, NO_x, CO₂, CO_{2e}, CH₄, and N₂O in lb/MWh, are reported in the Plant file. The output emission rates are calculated as total annual adjusted emissions divided by annual net generation.

Input emission rates for SO₂, NO_x, CO₂, CO_{2e}, CH₄, and N₂O in lb/MMBtu, are calculated as the total annual emissions divided by the annual heat input.

Fuel-based Emission Rates

For the State, Balancing Authority, eGRID Subregion, NERC Region, and US eGRID files, coal, oil, gas, and fossil fuel output and input emission rates are calculated based on a plant's primary fuel (see Section 3.2). If a plant's primary fuel is coal, oil, gas, or another fossil fuel, then all of its adjusted emissions, adjusted heat input, and net generation from combustion are included in the respective aggregation level for that fuel category. For example, all plants in Alabama with coal as primary fuel will have their emissions, heat input, and combustion net generation summed to the state level and then the appropriate calculations will be applied to determine the coal-based output and input emission rates for Alabama. See Table 3-3 for a list of primary fuels and fuel categories used for fuel-

SPECIFIC eGRID IDENTIFIER CODES, NAME CHANGES AND ASSOCIATIONS

based emission rates in the State, Balancing Authority, eGRID Subregion, NERC Region, and US eGRID files.

Table 3-3. Fuel-based Emission Rates – Primary Fuel Category

Fuel Code	Description	Fuel Category
BIT	Bituminous coal	Coal
LIG	Lignite coal	Coal
SUB	Subbituminous coal	Coal
RC	Refined coal	Coal
WC	Waste coal	Coal
SGC	Coal-derived synthetic gas	Coal
COG	Coke oven gas	Coal
NG	Natural gas	Gas
BU	Butane gas	Gas
DFO	Distillate fuel oil	Oil
JF	Jet fuel	Oil
KER	Kerosene	Oil
PC	Petroleum coke	Oil
RG	Refinery gas	Oil
RFO	Residual fuel oil	Oil
WO	Waste oil	Oil
BFG	Blast furnace gas	Other fossil
OG	Other gas	Other fossil
TDF	Tire-derived fuel	Other fossil

Nonbaseload Emission Rates

In addition to emission rates for all plants, eGRID also reports emission rates for nonbaseload plants in the State, Balancing Authority, eGRID Subregion, NERC Region, and US eGRID files. The nonbaseload emission rates are sometimes used as an estimate to determine the emissions that could be avoided through projects that displace marginal fossil fuel generation, such as energy efficiency and/or renewable energy.

Capacity factor is used as a surrogate for determining the amount of nonbaseload generation and emissions that occur at each plant. While there are other factors that can influence a particular unit's capacity factor besides dispatch or load order (e.g. maintenance and repairs), capacity factor is used as a surrogate for dispatch-order for this calculation. The nonbaseload information is published in eGRID at the aggregate level (state, balancing authority, eGRID subregion, NERC region, and the US), but not for individual plants.

SPECIFIC eGRID IDENTIFIER CODES, NAME CHANGES AND ASSOCIATIONS

The nonbaseload emission rates are determined based on the plant-level capacity factor. All generation and emissions at plants with a low capacity factor (less than 0.2) are considered nonbaseload and are assigned a nonbaseload factor of 1. Plants with a capacity factor greater than 0.8 are considered baseload and are assigned a nonbaseload factor of 0. For plants with a capacity factor between 0.2 and 0.8, we use a linear relationship to determine the percent of generation and emissions that is nonbaseload:

$$\text{Nonbaseload Factor} = -5/3 \times (\text{Capacity Factor}) + 4/3$$

To aggregate the nonbaseload generation and emissions, the plant-level generation and emissions are multiplied by the nonbaseload factor and summed to the state, balancing authority, eGRID subregion, NERC region, and US levels. The aggregated nonbaseload emissions and generation are used to calculate the nonbaseload output emission rates.

While nonbaseload rates can be used to estimate the emissions reductions associated with projects that displace electricity generation, such as energy efficiency and/or renewable energy, these rates should not be used for assigning an emission value for electricity use in carbon-footprinting exercises or GHG emissions inventory efforts. Rather, eGRID subregion-level total output emission rates are recommended for estimating emissions associated with electricity use (scope 2 emissions).

Note that generation from renewable fuels is not included in the nonbaseload calculations.

Combustion Emission Rates

Combustion output emission rates for all pollutants are estimated at the plant level and higher levels of aggregation. Combustion fuel-based output emissions rates are calculated by dividing total plant emissions by the combustion net generation for that plant. Generation from non-combustion sources, such as nuclear, hydro, geothermal, solar, and wind will not be included in the calculation of this rate.

3.2 Determination of Plant Primary Fuel

The primary fuel of a plant is determined solely by the fuel that has the maximum heat input in the Unit file.

For plants that do not consume any combustible fuel, the primary “fuel” is determined by the nameplate capacity of the units at the plant. The fuel from the unit with the highest nameplate capacity is used as the primary fuel.

See Section 5 for a description of all possible unit and plant primary fuel codes.

The EIA-923 includes solid waste plants as two fuel codes: municipal solid waste – biomass (MSB) and municipal solid waste – non-biomass (MSN). The EIA-860 only lists municipal solid waste under one code (MSW). In eGRID2019 the MSW fuel code is the only fuel code used for municipal solid waste in the Unit, Generator, and Plant files. While the MSB/MSN EIA-923 fuel information is used to calculate biomass adjusted emissions, these fuel codes are not listed in eGRID2019. See Section 3.1.2.1 for a discussion of the biomass adjustment methodology (EIA, 2020c).

SPECIFIC eGRID IDENTIFIER CODES, NAME CHANGES AND ASSOCIATIONS

3.3 Estimation of Resource Mix

The resource mix is the collection of nonrenewable and renewable resources that are used to generate electricity for a plant. Nonrenewable resources include fossil fuels (e.g., coal, oil, gas, and other fossil) and nuclear energy sources; renewable energy resources include biomass, solar, wind, geothermal, and hydro. The resource mix is determined by calculating the percentage of the total generation that a given nonrenewable or renewable resource generated. In eGRID, the resource mix is represented as generation, in MWh, for each nonrenewable or renewable resource category, as well as a percentage of the total. Each category for nonrenewable and renewable resources should sum to be 100 percent. eGRID plant resource mix and net generation are derived from the EIA-923 prime mover level data.

For cases in which there is only one fuel and its generation is negative, that fuel's generation percent is assigned 100%. For cases in which there are fuels with both negative and positive net generation, the generation percentages only include the positive generation in both the denominator and numerator.

For the three grouped aggregate categories—total net generation from nonrenewables, total net generation from all renewables, and total net generation from renewables minus hydro—the sum of the total net generation from nonrenewables and from all renewables equals the total net generation.

It should be noted that there are cases where the sum of the generation by fuel type does not equal the value reported for total annual generation in eGRID. This is because the total annual generation is calculated using a mix of generator- and prime mover-level data from the EIA-923. The calculation of generation by fuel type uses only prime mover-level data (EIA, 2020c).

3.4 Aggregating Plant-Level Data

eGRID includes five aggregated files based on the Plant file: State, Balancing Authority (BA), eGRID Subregion, NERC Region, and the US. The State file data are developed by summing up the Plant file data (adjusted heat input, adjusted emissions, adjusted fuel-based emissions, net generation, fuel-based net generation, nameplate capacity, and the plant data values needed to calculate nonbaseload emission rates), based on the state in which the plant is located. The Balancing Authority, eGRID Subregion, and NERC Region files are developed by summing up the plant data for each of the values for each aggregation level. The US file is developed by taking the sum of all fields for all plants from the Plant file.

Emission rates are recalculated at the state, balancing authority, eGRID subregion, NERC region, and US levels. Nonbaseload emission rates have also been included at the aggregated level. For a list of all variables included in the aggregated files, see Sections 5.4 through 5.8.

The totals from the Plant, State, Balancing Authority, eGRID Subregion, NERC Region, and US files' adjusted heat input, adjusted emissions, adjusted fuel-based emissions, net generation, fuel-based net generation, and nameplate capacity data are equal, accounting for minor differences due to rounding.

The following sections describe three of the levels of aggregation used to summarize the data from the Plant file, including the balancing authority, eGRID subregion, and NERC region levels.

SPECIFIC eGRID IDENTIFIER CODES, NAME CHANGES AND ASSOCIATIONS

3.4.1 Balancing Authority

A balancing authority is a portion of an integrated power grid for which a single dispatcher has operational control of all electric generators. A balancing authority is the responsible entity that integrates resource plans ahead of time, maintains demand and resource balance within a BA area, and supports interconnection frequency in real time. The balancing authority dispatches generators in order to meet an area's needs and can also control load to maintain the load-generation balance.

Balancing authority ID codes are assigned to a plant based on the EIA-860 plant-level data and the balancing authority names are assigned to the corresponding balancing authority ID codes based on the EIA-861 (EIA, 2020a; EIA, 2020d). In Alaska, Hawaii, and Puerto Rico, isolated electric utility systems, which are not part of an integrated power grid, have been grouped into nominal balancing authorities titled Alaska Miscellaneous, Hawaii Miscellaneous, and Puerto Rico Miscellaneous, respectively. These three balancing authorities have an ID code of "NA" since there are no ID codes available from EIA for these regions. Other plants with no listed balancing authority ID in the EIA-860 plant-level data have a code of "NA" and name of "No Balancing Authority" in eGRID2019.

The balancing authority associated with a plant is reported to the EIA-860 plant-level data and used in eGRID2019.

Since BAs are not strictly geographically based, shapefiles for mapping them are not available with eGRID2019.

3.4.2 eGRID Subregion

eGRID subregions are identified and defined by EPA and were developed as a compromise between NERC regions (which EPA felt were too big) and balancing authorities (which EPA felt were generally too small). Using NERC regions and balancing authorities as a guide, the subregions were defined to limit the import and export of electricity in order to establish an aggregated area where the determined emission rates most accurately matched the generation and emissions from the plants within that subregion.

A map of the eGRID subregions used for eGRID2019 is included in Appendix B. This map is representational and shows approximate boundaries that are based on electrical grid attributes, not on strict geographical boundaries.⁷

The 27 eGRID subregions are subsets of the NERC regions as configured in December 2010. The eGRID subregions themselves have not changed substantially since eGRID2000. Note, however, that some plants operating in each eGRID subregion can change from year to year. A new subregion, Puerto Rico Miscellaneous (PRMS), was added in eGRID2019 with the addition of Puerto Rico data.

Plants are assigned to eGRID subregions in a multi-step process using NERC regions, balancing authorities (BAs), Transmission IDs, Utility IDs, and NERC assessment data as a guide.

⁷ Note that some areas may fall into multiple eGRID subregions due to the fact that they are supplied by multiple electricity providers. Visit Power Profiler (<https://www.epa.gov/energy/power-profiler>) for more information on determining the eGRID subregion for a given area.

SPECIFIC eGRID IDENTIFIER CODES, NAME CHANGES AND ASSOCIATIONS

- First, there is one NERC region that is located entirely within an eGRID subregion. Plants in NERC regions TRE (within eGRID subregion ERCT) are directly assigned the corresponding eGRID subregion.
- Second, plants in BAs where the entire BA is located within the boundaries of an eGRID subregion are assigned accordingly (e.g., BA CISO is entirely within the boundaries of eGRID subregion CAMX).
- Third, the Transmission or Distribution System Owner ID for each plant, reported in the EIA-860, in combination with their BA, is used to identify eGRID subregions for the remaining BAs that do not have a one-to-one match with an eGRID subregion.
- Fourth, there are some plants that do not report Transmission ID or where the Transmission ID and BA span multiple eGRID subregions so an additional step using Utility ID, reported in the EIA-860, is used to identify additional eGRID subregion matches.
- The last step in the process uses Long Term Reliability Assessment data, received from NERC, to assign additional plants to eGRID subregions based on their NERC assessment area.

After completing these five steps, there may be a few plants that were not assigned to an eGRID subregion. If the plant is operational (and not retired or proposed with no heat input, generation, or emissions data), the historical assignments were retained for these plants, if applicable. For unassigned plants that were new plants in 2019, manual assignments were made based on the plant's physical location. All of the plants in Puerto Rico were assigned to the PRMS eGRID subregion.

The 27 eGRID subregion names and their acronyms for eGRID are displayed in Table 3-4.

Table 3-4. eGRID Subregion Acronym and Names for eGRID

eGRID Subregion	eGRID Subregion Name
FRCC	FRCC All
MROE	MRO East
MROW	MRO West
NEWE	NPCC New England
NYCW	NPCC NYC/Westchester
NYLI	NPCC Long Island
NYUP	NPCC Upstate NY
PRMS	Puerto Rico Miscellaneous
RFCE	RFC East
RFCM	RFC Michigan
RFCW	RFC West
SRMW	SERC Midwest
SRMV	SERC Mississippi Valley

SPECIFIC eGRID IDENTIFIER CODES, NAME CHANGES AND ASSOCIATIONS

eGRID Subregion	eGRID Subregion Name
SRSO	SERC South
SRTV	SERC Tennessee Valley
SRVC	SERC Virginia/Carolina
SPNO	SPP North
SPSO	SPP South
CAMX	WECC California
NWPP	WECC Northwest
RMPA	WECC Rockies
AZNM	WECC Southwest
ERCT	ERCOT All
AKGD	ASCC Alaska Grid
AKMS	ASCC Miscellaneous
HIOA	HICC Oahu
HIMS	HICC Miscellaneous

3.4.3 NERC Region

NERC region refers to a region designated by the North American Electric Reliability Corporation (NERC). Each NERC region listed in eGRID represents one of nine regional portions of the North American electricity transmission grid: six in the contiguous United States, plus Alaska, Hawaii, and Puerto Rico (which are not part of the formal NERC regions, but are considered so in eGRID). Note that some plants can change NERC region from year to year. The nine NERC region names and their acronyms for eGRID are displayed in Table 3-5.

Although some NERC regions include portions of Canada and/or Mexico that are integrated with U.S. grids, eGRID aggregation data are limited to generation within the U.S.

A representation of the NERC region map used for eGRID is included in Figure B-2 in Appendix B. This map is representational and shows approximate boundaries that are not based on strict geographical boundaries.

SPECIFIC eGRID IDENTIFIER CODES, NAME CHANGES AND ASSOCIATIONS

Table 3-5. NERC Region Acronym and Names for eGRID

NERC Region	NERC Name
ASCC	Alaska Systems Coordinating Council
HICC	Hawaiian Islands Coordinating Council
MRO	Midwest Reliability Organization
NPCC	Northeast Power Coordinating Council
PR	Puerto Rico
RFC	Reliability First Corporation
SERC	SERC Reliability Corporation
TRE	Texas Regional Entity
WECC	Western Electricity Coordinating Council

Note that as of 2019, FRCC was no longer a NERC region (FERC, 2019).

3.5 Grid Gross Loss

eGRID output emission rates do not account for any line losses between the points of consumption and the points of generation. For example, because there are line losses, one kilowatt hour of electricity consumption requires a little more than one kilowatt hour of electricity generation. To account for transmission and distribution line losses when applying eGRID output emission rates to electricity consumption within a certain region, consumption is divided by (one minus the grid gross loss [as a decimal]) (Table 3-6).

The methodology for calculating grid gross loss uses data from EIA's State Electricity Profiles.⁸ Utilities report the information used in these calculations directly to EIA through EIA-861. EIA does not include Puerto Rico in their State Electricity Profiles, so Puerto Rico is not included in the grid gross loss estimates for eGRID2019.

To align more closely with EIA estimates, the methodology for calculating GGL changed slightly in 2017. The previous methodology used for eGRID2014 and eGRID2016 did not account for interstate trade values that were included in total disposition for each state, which led to a slight double counting of values. The revised methodology excludes net exports from each state's total disposition. The formula for calculating GGL remains nearly the same as the previous methodology, with the exception that net interstate exports are subtracted from the total disposition in the denominator.

The methodology for estimating grid gross loss uses the following data points for each state from the EIA State Electricity Profiles:

1. Total Disposition. This is the total amount of electricity sold directly to customers, sold for resale, furnished without charge, consumed by the respondent without charge, and lost. It is equal to the total amount of electricity generated.

⁸ Available at: <http://www.eia.gov/electricity/state/> See Table 10: Supply and disposition of electricity

SPECIFIC eGRID IDENTIFIER CODES, NAME CHANGES AND ASSOCIATIONS

2. Net Interstate Exports. This is the total amount of electricity exported to other states.
3. Direct Use. This is the total amount of electricity used by plants and/or utilities in the region that is not sold for wholesale or resale; direct use electricity is not transmitted through the grid and therefore does not have the potential to be lost.
4. Estimated Losses. This is the total amount of electricity, in MWh, in the region that is generated but is not sold for resale or wholesale, furnished without charge, or used by the generator or utility; i.e., electricity that is lost in transmission and distribution.

These data are reported at the state level by EIA. We aggregate them to the NERC Interconnect level (Eastern, Western, ERCOT (Texas), as well as the states of Alaska and Hawaii, and the entire U.S.). State boundaries, however, do not perfectly correspond to Interconnect boundaries. Four states (Montana, Nebraska, New Mexico, and South Dakota) have generation in two Interconnects, and one state (Texas) has generation in three Interconnects. For these states, we distributed the data from the State Electricity Profiles based on the proportion of generation from these states in each Interconnect from the EIA-923 (EIA, 2020c).

The aggregated data are then used to calculate grid gross loss as follows:

$$\text{Grid Gross Loss} = \frac{\text{Estimated Losses}}{\text{Total Disposition without Exports} - \text{Direct Use}}$$

The eGRID2019 estimated grid gross loss percentages for each U.S. interconnect power grid are included in the worksheet called “GGL19” in the eGRID workbook and are also displayed in Table 3-6.

Table 3-6. eGRID2019 Grid Gross Loss (%)

Power Grid	Grid Gross Loss (%)
Eastern	5.4%
Western	5.1%
ERCOT	5.1%
Alaska	5.5%
Hawaii	5.1%
U.S.	5.1%

SPECIFIC eGRID IDENTIFIER CODES, NAME CHANGES AND ASSOCIATIONS

4. Specific eGRID Identifier Codes, Name Changes, and Associations

4.1 Plant Level

4.1.1 Plant ID Changes

Some changes to EIA ORISPL ID codes are made in eGRID2019 to better reflect CAMD's Power Sector Emissions Data.

Some EIA plants are combined into single plants to reflect CAMD's Power Sector Emissions Data.

- The plants ArcelorMittal Indiana Harbor West and Indiana Harbor E 5 AC Station (ORISPL 10397 and 54995, respectively) are combined and the ORISPL changed to 10474 to match with the ArcelorMittal USA – Indiana Harbor East plant from CAMD's Power Sector Emissions Data.
- The plants Sundevil Power Holdings – Gila River and Gila River Power Block 3 (ORISPL 59338 and 59784, respectively) are combined and the ORISPL changed to 55306 to match with the Gila River Power Station plant from CAMD's Power Sector Emissions Data.
- The plants Wayne County and Lee Combined Cycle Plant (ORISPL 7538 and 58215, respectively) are combined and the ORISPL changed to 2709 to match with the H F Lee Steam Electric Plant from CAMD's Power Sector Emissions Data.

Some plants in CAMD's Power Sector Emissions Data are combined into single plants to reflect EIA data.

- The plants Frank M Tait Station and Tait Electric Generating Station (ORISPL 2847 and 55248, respectively) in CAMD's Power Sector Emissions Data are listed as one plant, Tait Electric Generating Station (ORISPL 2847), in EIA data. This plant was previously listed under both ORISPL ID codes in EIA. For eGRID2019 we have updated the ORISPL ID codes for this plant in CAMD's Power Sector Emissions Data so they are listed as one plant, matching the EIA update.

A table of ORISPL ID code changes can be found in Table C-5 in Appendix C.

4.1.2 Generator/Unit ID Changes

Some changes to EIA generator IDs were made due to duplicate generator IDs showing up in eGRID2019 after changes to Plant IDs were made (see Section 4.1.1 above).

- Three generator IDs for retired generators at the H F Lee Steam Electric Plant (ORISPL 2709) were changed from 1, 2, and 3 to 01, 02, and 03 to remove duplicate generator IDs.
- Three generator IDs for generators at the V H Braunig (ORISPL 3612) were changed from 1, 2, and 3 to 01, 02, and 03 to remove duplicate generator IDs.

Some changes to CAMD's Power Sector Emissions Data Unit ID codes are made in eGRID2019 when renewable fuel units from EIA data have matching Unit ID codes.

SPECIFIC eGRID IDENTIFIER CODES, NAME CHANGES AND ASSOCIATIONS

- The CAMD's Power Sector Emissions Data Unit ID codes from the Blewett plant (ORISPL 2707) were changed. There are 4 renewable units from EIA that had the same Unit ID codes, so the Unit ID codes from CAMD's Power Sector Emissions Data were changed to match the corresponding EIA Unit ID codes (from 1, 2, 3, and 4 to GT1, GT2, GT3, and GT4).

4.1.3 Longitude/Latitude Updates

The following plants had the wrong latitude and longitude listed in the EIA-860 Plant file. The following updates, shown in Table 4-1, have been made based on the address provided in the EIA-860 Plant file for each plant.

Table 4-1. eGRID2019 Latitude/Longitude Updates

Plant ID	Plant Name	Latitude	Longitude
62262	Rolling Upland Wind Farm LLC	42.899029	-75.458456
63003	Midland Wind	41.000000	-89.996844

4.1.4 EPA/CAMD Plants Not Connected to the Grid

There are several plants included in CAMD's Power Sector Emissions Data that are not connected to the electric grid and are therefore removed from eGRID2019. All plants that have an ORISPL code that starts with an 88 followed by four digits are not included in eGRID2019. Not all non-grid-connected facilities follow this practice. Table 4-2 below provides a list of plants that have been removed from eGRID2019 that do not have an ORISPL code beginning with 88.

SPECIFIC eGRID IDENTIFIER CODES, NAME CHANGES AND ASSOCIATIONS

Table 4-2. eGRID2019 EPA/CAMD Plants Not Connected to the Grid

Plant ID	State	Plant Name
478	CO	Zuni
1594	MA	Blackstone

5. Description of Data Elements

eGRID2019 has 8 aggregation files: UNIT (unit), GEN (generator), PLNT (plant), ST (state), BA (Balancing Authority), SRL (eGRID subregion), NRL (NERC region), and the US (United States total). eGRID2019 also includes the regional grid gross loss factor data. Appendix A provides the file structure for eGRID2019, which includes variable descriptions and original data sources. Note that definitions for similar variables are not repeated after the description in the Plant file. For example, in the Plant file, the net generation in MWh is defined at the plant level for the data element PLNGENAN. For each subsequent file, the net generation, XXNGENAN (where XX is ST, BA, SR, NR, or the US) is not defined; it is simply the sum of PLNGENAN attributed to the aggregation entity.

Note that values reported as 0 in eGRID are reported as 0 in the original data files. Values reported as blank in eGRID are either reported as blank in the original data files or are not included in the original data files. The following data element descriptions apply to fields in both the English unit and metric unit workbooks, but the descriptions below only are only represented in English units.

5.1 The UNIT (Unit) File

There are 32 variables in the Unit file, which contains unit-level data.

1. **eGRID2019 Unit File Sequence Number (SEQUNT19)** –
Unit-level records in the 2019 data file are sorted by state abbreviation, plant name, plant code, and unit ID, and are assigned a unique sequential number beginning with 1. This sequence number is unlikely to be the same as the sequence number in the eGRID2018 file for the same entity.
2. **Data Year (YEAR)** –
The current eGRID data year.
3. **Plant State Abbreviation (PSTATABB)** –
The state abbreviation of the state in which the plant is located.
Source: EIA-860
4. **Plant Name (PNAME)** –
The name associated with each plant.
Source: EPA/CAMD; EIA-860
5. **DOE/EIA ORIS Plant or Facility Code (ORISPL)** –
This plant code corresponds to PNAME and was originally developed for power plants by the Office of Regulatory Information Systems (ORIS), which was a part of the Federal Power Commission. It is now assigned by EIA and is used as a unique plant identification code for many EPA electric power databases. Note that some EIA ORISPL ID codes were changed to reflect CAMD's Power Sector Emissions Data ORISPL ID codes. See Section 4.1 for a discussion of ORISPL ID changes made to eGRID2019. See Appendix C for a table of all ORISPL changes made between EIA and CAMD's Power Sector Emissions Data.
Source: EPA/CAMD; EIA-860

6. Unit ID (UNITID) –

The unit ID for the unit that produces the emissions.

Source: EPA/CAMD, EIA-923

7. Prime Mover (PRMVR) –

The unit's electric prime mover type.

Possible values are:

BA	= Battery energy storage
BT	= Binary cycle turbine
CA	= Combined cycle steam turbine
CC	= Combined cycle - total unit
CE	= Compressed air energy storage
CP	= Concentrated solar power energy storage
CS	= Combined cycle - single shaft
CT	= Combined cycle combustion turbine
FC	= Fuel cell
FW	= Flywheel energy storage
GT	= Combustion (gas) turbine
HY	= Hydroelectric turbine
IC	= Internal combustion engine (diesel)
OT	= Other turbine
PS	= Hydraulic turbine - reversible (pumped storage)
PV	= Photovoltaic
ST	= Steam turbine (boiler, nuclear, geothermal, and solar steam)
WS	= Wind turbine - offshore
WT	= Wind turbine - onshore

Source: EIA-860

8. Unit Operational Status (UNTOPST) –

The unit's operational status in 2019. Possible values are:

CN	= Cancelled (previously reported as “planned”)
CO	= New unit under construction
Future	= Planned new generator
IP	= Planned new generator canceled, indefinitely postponed, or no longer in resource plan
L	= Regulatory approvals pending (not under construction)
OA	= Out of service (returned or will be returned to service)
OP	= Operating – in service
OS	= Out of service (not expected to be returned to service)
OT	= Other
P	= Planned for installation but regulatory approvals not initiated (not under construction)
RE	= Retired – no longer in service
SB	= Stand-by (long-term storage)
SC	= Cold stand-by (reserve); deactivated
T	= Regulatory approvals received (not under construction)
TS	= Testing, construction complete, but not yet in commercial operation

DESCRIPTION OF DATA ELEMENTS

U = Under construction, less than 50% constructed
V = Under construction, more than 50% constructed
Source: EPA/CAMD, EIA-860

- 9. Clean Air Markets Division (CAMD) Program Flag (CAMDFLAG) –**
Indicates if the unit was included in CAMD's Power Sector Emissions Data in 2019.
See <https://www.epa.gov/airmarkets/clean-air-markets-programs> for additional information.
Source: EPA/CAMD

- 10. Program Codes (PRGCODE) –**
The programs, as reported to CAMD's Power Sector Emissions Data, that the unit was subject to in 2019. Values may be combined and separated by commas. The individual values are:

ARP	= Acid Rain Program
CSNOX	= Cross-State Air Pollution Rule for NO _x (annual)
CSOSG1, CSOSG2	= Cross-State Air Pollution Rule NO _x Ozone Season Program (Group 1, Group 2)
CSSO2G1, CSSO2G2	= Cross-State Air Pollution Rule for SO ₂ (Group 1, Group 2)
MATS	= Mercury and Air Toxics Standards
NHNOX	= New Hampshire's special NO _x program
NSPS4T	= New Source Performance Standards Subpart TTTT Program
RGGI	= Regional Greenhouse Gas Initiative
SIPNOX	= NO _x SIP Call
TXSO2	= Texas SO ₂ Trading Program

See <https://www.epa.gov/airmarkets/clean-air-markets-programs> for additional information.
Source: EPA/CAMD

- 11. Unit Bottom and Firing Type (BOTFIRTY) –**
The unit firing type.
Possible values are:

	= Blank
CC	= Combined cycle
CELL	= Cell
CT	= Combustion turbine
CYCLONE	= Cyclone firing
DUCTBURNER	= Ductburner
FLUIDIZED	= Fluidized bed firing
IGC	= Integrated gasification combined cycle
OTHER BOILER	= Other boiler
OTHER TURBINE	= Other turbine
PROCESS	= Refinery process heater
STOKER	= Stoker, spreader, vibrating grate, or slinger boiler
TANGENTIAL	= Tangential, concentric, or corner-fired boiler

DESCRIPTION OF DATA ELEMENTS

TURBO	= Turbo
VERTICAL	= Vertically-fired boiler
VERTICAL/ARCH	= Vertical or arch firing
WALL	= Wall-fired boiler

Source: EPA/CAMD, EIA-860

12. Number of Associated Generators (NUMGEN) –

The number of generators associated with each EIA-860 boiler in the file.

Source: EIA-860

13. Unit Primary Fuel (FUELU1) –

The primary fuel determined from EIA-923 boiler or generator reported data or the primary fuel reported to CAMD's Power Sector Emissions Data.

Possible values are:

AB	= Agricultural byproduct
BFG	= Blast furnace gas
BIT	= Bituminous coal
BLQ	= Black liquor
COG	= Coke oven gas
DFO	= Distillate fuel oil, light fuel oil, diesel oil
GEO	= Geothermal
JF	= Jet fuel
KER	= Kerosene
LFG	= Landfill gas
LIG	= Lignite coal
MSW	= Municipal solid waste
MWH	= Electricity used for energy storage (megawatthour)
NG	= Natural gas
NUC	= Nuclear
OBG	= Other biomass gas (digester gas, methane, and other biomass gases)
OBL	= Other biomass liquids
OBS	= Other biomass solid
OG	= Other gas
OTH	= Other
PC	= Petroleum coke
PG	= Gaseous propane
PRG	= Process gas
PUR	= Purchased steam
RC	= Refined coal
RFO	= Residual fuel oil, heavy fuel oil, petroleum
SGC	= Coal-derived synthetic gas
SLW	= Sludge waste
SUB	= Subbituminous coal
SUN	= Solar
TDF	= Tire-derived fuel
WAT	= Water
WC	= Waste coal
WDL	= Wood, wood waste liquid

WDS	= Wood, wood waste solid
WH	= Waste heat
WND	= Wind
WO	= Waste oil

Source: EPA/CAMD; EIA-923, EIA-860

- 14. Unit Operating Hours (HRSOP) –**
The number of hours that a unit from CAMD's Power Sector Emissions Data reported operating during the year.
Source: EPA/CAMD
- 15. Unit Unadjusted Annual Heat Input (HTIAN) –**
The unit's unadjusted annual total heat input, in MMBtu, based on the values reported to CAMD's Power Sector Emissions Data or calculated using EIA-923 unit data.
Source: EPA/CAMD; EIA-923
- 16. Unit Unadjusted Ozone Season Heat Input (HTIOZ) –**
The unit's unadjusted ozone season (May through September) heat input, in MMBtu, based on the values reported to CAMD's Power Sector Emissions Data or calculated using EIA-923 unit data.
Source: EPA/CAMD; EIA-923
- 17. Unit Unadjusted Annual NO_x Emissions (NOXAN) –**
The unit's unadjusted NO_x emissions, in short tons, based on the values reported to CAMD's Power Sector Emissions Data or calculated using EIA-923 unit data and unit-specific emissions rates or the emission factors listed in Appendix C.
Source: EPA/CAMD; EIA-923
- 18. Unit Unadjusted Ozone Season NO_x Emissions (NOXOZ) –**
The unit's unadjusted ozone season (May through September) NO_x emissions, in short tons, based on values reported to CAMD's Power Sector Emissions Data or calculated using EIA-923 unit data and unit-specific ozone-season emissions rates or the emission factors listed in Appendix C.
Source: EPA/CAMD; EIA-923
- 19. Unit Unadjusted Annual SO₂ Emissions (SO2AN) –**
The unit's unadjusted annual SO₂ emissions, in short tons, based on the values reported to CAMD's Power Sector Emissions Data or calculated using EIA-923 unit data and the emission factors listed in Appendix C. When not available, it is zero.
Source: EPA/CAMD; EIA-923
- 20. Unit Unadjusted Annual CO₂ Emissions (CO2AN) –**
The unit's unadjusted annual CO₂ emissions, in short tons, based on the values reported to CAMD's Power Sector Emissions Data or calculated using EIA-923 unit data and emission factors listed in Appendix C.
Source: EPA/CAMD; EIA-923

21. **Unit Unadjusted Annual Hg Emissions (HGAN) –**
The unit's unadjusted annual Hg emissions, in pounds, based on the values reported to CAMD's Power Sector Emissions Data.
Source: EPA/CAMD
22. **Unit Unadjusted Annual Heat Input Source (HTIANSRC)**
Identifies the annual heat input data source.
Source: EPA/CAMD; EIA-923
23. **Unit Unadjusted Ozone Season Heat input source (HTIOZSRC)**
Identifies the ozone season heat input data source.
Source: EPA/CAMD; EIA-923
24. **Unit Unadjusted Annual NOx Emissions Source (NOXANSRC)**
Identifies the annual NOx emissions data source.
Source: EPA/CAMD; EIA-923
25. **Unit Unadjusted Ozone Season NOx Emissions Source (NOXOZSRC)**
Identifies the ozone-season NOx emissions data source.
Source: EPA/CAMD; EIA-923
26. **Unit Unadjusted Annual SO₂ Emissions Source (SO2SRC)**
Identifies the annual SO₂ emissions data source.
Source: EPA/CAMD; EIA-923
27. **Unit Unadjusted Annual CO₂ Emissions Source (CO2SRC)**
Identifies the annual CO₂ emissions data source.
Source: EPA/CAMD; EIA-923
28. **Unit Unadjusted Annual Hg Emissions Source (HGSRC)**
Identifies the annual Hg emissions data source.
Source: EPA/CAMD
29. **Unit SO₂ (Scrubber) First Control Device (SO2CTLDV) –**
The first reported SO₂ control device. Values may be combined and separated by commas.
Possible values are:

=	blank
CD	= Circulating dry scrubber
DA	= Dual alkali
DL	= Dry lime flue gas desulfurization unit
DSI	= Dry sorbent (powder) injection type
EK	= Electrostatic precipitator, cold side, without flue gas conditioning
FBL	= Fluidized bed
JB	= Jet bubbling reactor (wet) scrubber
LIJ	= Lime injection
MA	= Mechanically aided type (wet) scrubber
O	= Other (EPA/CAMD)

OT	= Other equipment (EIA-860)
PA	= Packed type (wet) scrubber
SB	= Sodium based
SD	= Spray dryer type/dry FGD/semi-dry FGD
SP	= Spray type (wet) scrubber
TR	= Tray type (wet) scrubber
VE	= Venturi type (wet) scrubber
WL	= Wet lime flue gas desulfurization unit
WLS	= Wet limestone

Source: EPA/CAMD, EIA-860

30. Unit NO_x First Control Device (NOXCTLDV) –

The first reported NO_x control device. Values may be combined and separated by commas.

Possible values are:

	= Blank
CM	= Combustion modification/fuel reburning
DLNB	= Dry low NO _x premixed technology
EW	= Electrostatic precipitator, hot side, without flue gas conditioning
H2O	= Water injection
LNB	= Low NO _x burner
LNBO	= Low NO _x burner with overfire air
LNC1	= Low NO _x burner technology with close-coupled overfire air
LNC2	= Low NO _x burner technology with separated OFA
LNC3	= Low NO _x burner technology with close-coupled and separated overfire air
LNCB	= Low NO _x burner technology for cell burners
NH3	= Ammonia injection
O/OT	= Other
OFA	= Overfire air
SCR	= Selective catalytic reduction (EPA/CAMD)
SN	= Selective noncatalytic reduction (EIA-860)
SNCR	= Selective noncatalytic reduction (EPA/CAMD)
SR	= Selective catalytic reduction (EIA-860)
STM	= Steam injection

Source: EPA/CAMD, EIA-860

31. Unit Hg Activated Carbon Injected System Flag (HGCTLDV) –

The activated carbon injection mercury control flag.

Source: EIA-860

32. Unit Year On-Line (UNTYRONL) –

The four-digit year the unit came on-line.

Source: EPA/CAMD, EIA-860

5.2 The GEN (Generator) File

There are 17 variables in the second file, GEN, which contains generator level data. This file includes generation from steam boilers and nuclear units in the EIA-923, plant prime movers in the EIA-923

DESCRIPTION OF DATA ELEMENTS

that have only one generator in the EIA-860, and the EIA-923 plant prime movers where generation is distributed to the generator level based on nameplate capacity.

1. **eGRID2018 File Generator Sequence Number (SEQGEN19) –**
The generator records in the 2019 generator data file are sorted by state abbreviation, plant name, plant code, and generator ID, and are assigned a unique sequential number beginning with 1. This sequence number is unlikely to be the same as the sequence number in the eGRID2018 file for the same entity.
2. **Data Year (YEAR) –**
The current eGRID data year.
3. **Plant State Abbreviation (PSTATABB) –**
The state abbreviation in which the plant is located.
Source: EIA-860
4. **Plant Name (PNAME) –**
The name associated with each plant.
Source: EPA/CAMD; EIA-860
5. **DOE/EIA ORIS Plant or Facility Code (ORISPL) –**
This plant code was developed for power plants by the Office of Regulatory Information Systems (ORIS), which was a part of the Federal Power Commission. It is now assigned by EIA and is used as a unique plant identification code for many EPA electric power databases. Note that some EIA ORISPL ID codes were changed to reflect CAMD's Power Sector Emissions Data ORISPL ID codes. See Section 4.1 for a discussion of ORISPL ID changes made to eGRID2019. See Table C-5 in Appendix C for a table of all ORISPL changes made between EIA and CAMD's Power Sector Emissions Data.
Source: EPA/CAMD; EIA-860
6. **Generator ID (GENID) –**
The electrical generation unit (generator) at a plant. In the majority of cases, there is a one-to-one correspondence with the boiler ID if it is a steam generator.
Sources: EIA-860
7. **Number of Associated Boilers (NUMBLR) –**
The number of EIA-860 boilers associated with each generator in the file.
Sources: EIA-860
8. **Generator Status (GENSTAT) –**
The reported generator status at the end of 2019.
Possible values are:

CN	= Cancelled (previously reported as “planned”)
IP	= Planned new generator canceled, indefinitely postponed, or no longer in resource plan
L	= Regulatory approvals pending (not under construction)

DESCRIPTION OF DATA ELEMENTS

OA	= Out of service (returned or will be returned to service)
OP	= Operating – in service
OS	= Out of service (not expected to be returned to service)
OT	= Other
P	= Planned for installation but regulatory approvals not initiated (not under construction)
RE	= Retired – no longer in service
SB	= Stand-by (long-term storage)
T	= Regulatory approvals received (not under construction)
TS	= Testing, construction complete, but not yet in commercial operation
U	= Under construction, less than 50% constructed
V	= Under construction, more than 50% constructed

Generators with one of these above generator status values are considered potentially operating generators (including generators with status = ‘RE’, if the retirement date is 2019 or later).

Source: EIA-860

9. Generator Prime Mover Type (PRMVR) –

The reported generator’s electric generator type.

Possible values are:

BA	= Battery energy storage
BT	= Binary cycle turbine
CA	= Combined cycle steam turbine
CC	= Combined cycle - total unit
CE	= Compressed air energy storage
CP	= Concentrated solar power energy storage
CS	= Combined cycle - single shaft
CT	= Combined cycle combustion turbine
FC	= Fuel cell
FW	= Flywheel energy storage
GT	= Combustion (gas) turbine
HY	= Hydroelectric turbine
IC	= Internal combustion engine (diesel)
OT	= Other turbine
PS	= Hydraulic turbine - reversible (pumped storage)
PV	= Photovoltaic
ST	= Steam turbine (boiler, nuclear, geothermal, and solar steam)
WS	= Wind turbine - offshore
WT	= Wind turbine - onshore

Source: EIA-860

10. Generator Primary Fuel (FUELG1) –

The potential primary fuel reported for the generator.

Possible values are:

DESCRIPTION OF DATA ELEMENTS

AB	= Agricultural by-products
BFG	= Blast furnace gas
BIT	= Bituminous coal
BLQ	= Black liquor
COG	= Coke oven gas
DFO	= Distillate fuel oil, diesel, No. 1, No. 2, and No. 4 fuel oils
GEO	= Geothermal
JF	= Jet fuel
KER	= Kerosene
LFG	= Landfill gas
LIG	= Lignite coal
MSW	= Municipal solid waste
MWH	= Electricity
NG	= Natural gas
NUC	= Nuclear
OBG	= Other biomass gas (digester gas, methane, and other biomass gases)
OBL	= Other biomass liquids
OBS	= Other biomass solids
OG	= Other gas
OTH	= Other unknown
PC	= Petroleum coke
PG	= Gaseous propane
PRG	= Process gas
PUR	= Purchased steam
RC	= Refined coal
RFO	= Residual fuel oil
SGC	= Synthesis gas – coal-derived
SGP	= Synthesis gas – petroleum coke
SUB	= Subbituminous coal
SUN	= Solar
TDF	= Tire-derived fuel
WAT	= Water
WC	= Waste coal
WDL	= Wood waste liquid (excluding black liquor)
WDS	= Wood, wood waste solid
WH	= Waste heat
WND	= Wind
WO	= Waste oil

Source: EIA-860

11. Generator Nameplate Capacity (NAMEPCAP) –

The nameplate capacity, in MW, of the generator.

Source: EIA-860

12. Generator Capacity Factor (CFACT) –

This field is calculated at the generator level:

$$\text{CFACT} = (\text{GENNTAN}) / (\text{NAMEPCAP} * 8760).$$

The value should generally be between 0 and 1. However, according to reported data, there are outliers where, a generator's capacity factor is greater than 1. The capacity factor for plants with negative net generation is set to 0.

13. **Generator Annual Net Generation (GENNTAN)** –
The reported net generation in MWh.
Sources: EIA-923
14. **Generator Ozone Season Net Generation (GENNTOZ)** –
The generator five-month ozone season (May through September) net generation in MWh, based on monthly generator generation data.
Sources: EIA-923
15. **Generation Data Source (GENERSRC)** –
The data source of the generator net generation data. The values are as follows:
 - Blank (no generator level data)
 - Distributed from EIA-923 Generation and Fuel
 - EIA-923 Generator File
 - Data from EIA-923 Generator File overwritten with distributed data from EIA-923 Generation and Fuel
16. **Generator Year On-Line (GENYRONL)** –
The four-digit year the generator came on-line.
Source: EIA-860
17. **Generator Planned or Actual Retirement Year (GENYRRET)** –
The four-digit year the generator retired or is planned to retire.
Source: EIA-860

5.3 The PLNT (Plant) File

There are 140 variables in the Plant file (PLNT).

1. **eGRID2019 File Plant Sequence Number (SEQPLT19)** –
The plant records in the 2019 plant data file are sorted by state abbreviation and plant name, and are assigned a unique sequential number beginning with 1. This sequence number is unlikely to be the same as the sequence number in the eGRID2018 file for the same entity.
2. **Data Year (YEAR)** –
The current eGRID data year.
3. **Plant State Abbreviation (PSTATABB)** –
The state abbreviation in which the plant is located.
Source: EIA-860
4. **Plant Name (PNAME)** –
The name associated with each plant.
Source: EPA/CAMD; EIA-860

5. **DOE/EIA ORIS Plant or Facility Code (ORISPL) –**
This plant code corresponds to PNAME and was originally developed for power plants by the Office of Regulatory Information Systems (ORIS), which was a part of the Federal Power Commission. It is now assigned by EIA and is used as a unique plant identification code for many EPA electric power databases, too. Note that some EIA ORISPL ID codes were changed to reflect CAMD's Power Sector Emissions Data ORISPL ID codes. See Section 4.1 for a discussion of ORISPL ID changes made to eGRID2019. See Table C-5 in Appendix C for a table of all ORISPL changes made between EIA and CAMD's Power Sector Emissions Data.
Source: EPA/CAMD; EIA-860
6. **Plant Transmission or Distribution System Owner Name (OPRNAME) –**
The name associated with the owner of the transmission or distribution system company to which the plant is interconnected
Source: EIA-860
7. **Plant Transmission or Distribution System Owner ID (OPRCODE) –**
The transmission or distribution system owner ID. Each transmission or distribution system has a unique company code assigned by EIA, with some exceptions. Plants with no operating company ID assigned by EIA are listed as -9999 in eGRID2019.
Source: EIA-860
8. **Utility Name (UTLSRVNM) –**
The name of the owner of the utility service territory (a utility company or EGC) [and previously known as the utility service area] in which the plant is located.
Source: EIA-860
9. **Utility ID (UTLSRVID) –**
The unique ID code associated with the utility name.
Source: EIA-860
10. **Plant-level Sector (SECTOR) –**
The plant level sector name, assigned by the purpose, regulatory status, and CHP status at the plant.
Possible values are:
 - Commercial CHP
 - Commercial Non-CHP
 - Electric Utility
 - Industrial CHP
 - Industrial Non-CHP
 - Independent Power Producer (IPP) CHP
 - Independent Power Producer (IPP) Non-CHP
Source: EIA-860
11. **Balancing Authority Name (BANAME) –**
The name of the balancing authority for the plant. The balancing authority is associated with the plant's eGRID subregion and NERC region.

Source: EIA-860, EIA-861

12. **Balancing Authority Code (BACODE) –**
The code of the balancing authority for the plant.
Source: EIA-860, EIA-861
13. **NERC Region Acronym (NERC) –**
The acronym for the NERC region in which the plant is located. The NERC region is associated with the plant's BA and eGRID subregion. A representation of the eGRID NERC region map is included in Appendix B.
Source: EIA-860
14. **eGRID Subregion Acronym (SUBRGN) –**
The acronym for the eGRID subregion in which the plant is located. The eGRID subregion is associated with the plant's balancing authority and NERC region. A representation of the eGRID subregion map is included in Appendix B.
Source: EPA
15. **eGRID Subregion Name (SRNAME) –**
The name of the eGRID subregion in which the plant is located.
Source: EPA
16. **Plant Associated ISO/RTO Territory (ISORTO) –**
The name, if applicable, of the Independent System Operator (ISO) or Regional Transmission Organization (RTO) associated with the plant.
Possible values are CAISO, ERCOT, ISONE, MISO, NYISO, PJM, SPP, or blank.
Source: EIA-860
17. **Plant FIPS State Code (FIPSSST) –**
The two-digit Federal Information Processing Standards (FIPS) state character code of the state in which the plant is located. The codes are from the National Institute of Standards and Technology (US Census, 2017).
Source: US Census
18. **Plant FIPS County Code (FIPSCNTY) –**
The three digit FIPS county character code of the county in which the plant is located. The codes are from the National Institute of Standards and Technology (US Census, 2017).
Source: US Census
19. **Plant County Name (CNTYNAME) –**
The name of the county in which the plant is located.
Source: EIA-860
20. **Plant Latitude (LAT) –**
The latitude, in degrees to four decimal places, associated with the plant.
Source: EIA-860

- 21. Plant Longitude (LON) –**
The longitude, in degrees to four decimal places, associated with the plant.
Source: EIA-860
- 22. Number of Units (NUMUNT) –**
The number of operating units within a plant.
Source: EIA-860
- 23. Number of Generators (NUMGEN) –**
The number of potentially operating generators within a plant.
Source: EIA-860
- 24. Plant Primary Fuel (PLPRMFL) –**
The plant's primary fuel based on maximum heat input of fuel consumed by the plant. If the plant does not consume fuel, it is based on the maximum nameplate capacity. Possible values are:

AB	= Agricultural byproduct
BFG	= Blast furnace gas
BIT	= Bituminous coal
BLQ	= Black liquor
COG	= Coke oven gas
DFO	= Distillate fuel oil, light fuel oil, diesel oil
GEO	= Geothermal steam
JF	= Jet fuel
KER	= Kerosene
LFG	= Landfill gas
LIG	= Lignite coal
MSW	= Municipal solid waste
MWH	= Electricity used for energy storage (megawatthour)
NG	= Natural gas
NUC	= Nuclear material
OBG	= Other biomass gas
OBL	= Other biomass liquid
OBS	= Other biomass solid
OG	= Other gas
OTH	= Other (unknown)
PC	= Petroleum coke
PRG	= Process gas
PUR	= Purchased fuel (unknown)
RC	= Refined coal
RFO	= Residual fuel oil, heavy fuel oil, petroleum
SGC	= Coal-derived synthetic gas
SUB	= Subbituminous coal
SUN	= Sun
TDF	= Tire-derived fuel
WAT	= Water
WC	= Waste coal

WDL	= Wood, wood waste liquid
WDS	= Wood, wood waste solid
WH	= Waste heat
WND	= Wind
WO	= Waste oil

Source: EPA/CAMD; EIA-860

- 25. Plant Primary Coal/Oil/Gas/Other Fossil Fuel Category (PLFUELCT) –**
The fuel category for the primary fuel of the plant. This field is “COAL” if the plant’s primary fuel is derived from coal (fuel type = BIT, COG, LIG, RC, SGC, SUB, WC), “OIL” if it is derived from oil (DFO, JF, KER, PC, RFO, WO), “GAS” if it is derived from gas (BU, NG, PG), “OFSL” if it is another fossil fuel (BFG, OG, TDF), “NUCLEAR” if it is derived from nuclear (NUC), “HYDRO” if it is derived from hydro power (WAT), “SOLAR” if it is derived from solar power, (SUN), “WIND” if it is derived from wind power (WND), “GEOTHERMAL” if it is derived from geothermal power (GEO), “OTHF” if it is derived from waste heat/unknown/purchased (MWH, OTH, PRG, PUR, WH), and “BIOMASS” if it is derived from biomass sources (AB, BLQ, LFG, MSW, OBG, OBL, OBS, WDL, WDS).
- 26. Flag indicating if the plant burned or generated any amount of coal (COALFLAG) –**
A flag to indicate if the plant burned coal or if it has positive heat input and generated electricity from coal. The plant will not be flagged if the plant has negative coal generation and no coal heat input for 2019.
- 27. Plant Capacity Factor (CAPFAC) –**
The plant capacity factor, expressed with four decimal places. It is calculated as follows:
$$\text{CAPFAC} = (\text{PLNGENAN} / (\text{NAMEPCAP} * 8760))$$

Although the value should be between 0 and 1, there are outliers.
- 28. Plant Nameplate Capacity (NAMEPCAP) –**
The nameplate capacity of the plant, in MW.
Source: EIA-860
- 29. Nonbaseload Factor (NBFACTOR) –**
The proportion of generation that is considered nonbaseload generation. A value of 0 means that all of the generation is baseload generation. See Section 3 for more information.
Source: Calculated
- 30. Biogas/Biomass Plant Adjustment Flag (RMBMFLAG) –**
A biogas (landfill gas, digester gas)/biomass adjustment flag used to indicate where emissions are adjusted for plants using biogas or biomass fuels. A facility’s emissions reported in eGRID may be different from that reported in other EPA sources, such as CAMD’s Power Sector Emissions Data, due to this adjustment.

31. **Combined Heat and Power (CHP) Plant Adjustment Flag (CHPFLAG) –**
A flag to indicate if the plant is a CHP facility. A CHP facility's emissions and heat input reported in eGRID may be different from that reported in other EPA sources, such as CAMD's Power Sector Emissions Data, due to this adjustment.
Source: EPA/CAMD; EIA-860
32. **CHP Plant Useful Thermal Output (USETHRMO) –**
The useful thermal output, in MMBtu, estimated for a CHP facility.
Source: EIA-923 calculated
33. **CHP Plant Power to Heat Ratio (PWRTOHT) –**
The power to heat ratio for a CHP facility, which is the ratio of the heat value of electricity generated ($3413 * \text{kWh}$ output) to the facility's useful thermal output.
34. **CHP Plant Electric Allocation Factor (ELCALLOC) –**
The CHP plant's decimal fraction of the emissions that are attributed to electricity. It is derived as the ratio of the electric heat output to the sum of the electric and steam heat outputs, where the steam output is 75% of the useful thermal output. The electric allocation factor is used to allocate emissions from a CHP facility to both electricity generation and useful thermal output. For non-CHP plants, eGRID uses an electric allocation factor of 1.0.
35. **Plant Pumped Storage Flag (PSFLAG) –**
Indicates if the plant has at least one pumped storage generator.
Source: EIA-860
36. **Plant Annual Heat Input from Combustion (PLHTIAN) –**
The total annual heat input from combustion, in MMBtu, for the plant. For CHP plants, the value is adjusted by the electric allocation factor.
37. **Plant Ozone Season Heat Input from Combustion (PLHTIOZ) –**
The five-month ozone season (May through September) heat input from combustion, in MWh, for the plant. For CHP plants, the value is adjusted by the electric allocation factor.
38. **Plant Total Annual Heat Input (PLHTIANT) –**
The total annual heat input from combustion and noncombustion units, in MMBtu, for the plant. For CHP plants, the value is adjusted by the electric allocation factor.
39. **Plant Total Ozone Season Heat Input (PLHTIOZT) –**
The five-month ozone season (May through September) heat input from combustion and noncombustion units, in MWh, for the plant. For CHP plants, the value is adjusted by the electric allocation factor.
40. **Plant Annual Net Generation (PLNGENAN) –**
The total reported annual net generation, in MWh, for the plant, summed from the Unit file.
Source: EIA-923

- 41. Plant Ozone Season Net Generation (PLNGENOZ) –**
The five-month ozone season (May through September) net generation for the plant.
Source: EIA-923
- 42. Plant Annual NO_x Emissions (PLNOXAN) –**
The total annual NO_x emissions, in short tons, for the plant. Biogas components are adjusted. For CHP plants, the value is adjusted by the electric allocation factor. This adjusted emissions field is estimated by first making the biogas adjustment (if it exists) and then applying the electric allocation factor (if the plant is a CHP).
- 43. Plant Ozone Season NO_x Emissions (PLNOXOZ) –**
The five-month ozone season (May through September) NO_x emissions, in short tons, for the plant. Biogas components are adjusted. For CHP plants, the value is adjusted by the electric allocation factor. This adjusted emissions field is estimated by first making the biogas adjustment (if it exists) and then applying the electric allocation factor (if the plant is a CHP).
- 44. Plant Annual SO₂ Emissions (PLSO2AN) –**
The total annual SO₂ emissions, in short tons, for the plant. Landfill gas components are adjusted. For CHP plants, the value is adjusted by the electric allocation factor. This adjusted emissions field is estimated by first making the landfill gas adjustment (if it exists) and then applying the electric allocation factor (if the plant is a CHP).
- 45. Plant Annual CO₂ Emissions (PLCO2AN) –**
The total annual CO₂ emissions, in short tons, for the plant. All CO₂ emissions from biomass fuels are adjusted to zero. For CHP plants, the value is adjusted by the electric allocation factor. This adjusted emissions field is estimated by first making the biomass adjustment (if it exists) and then applying the electric allocation factor (if the plant is a CHP).
- 46. Plant Annual CH₄ Emissions (PLCH4AN) –**
The total annual CH₄ emissions, in pounds, for the plant. Biogas biomass components are adjusted. For CHP plants, the value is adjusted by the electric allocation factor. This adjusted emissions field is estimated by first making the biomass adjustment (if it exists) and then applying the electric allocation factor (if the plant is a CHP).
- 47. Plant Annual N₂O Emissions (PLN2OAN) –**
The total annual N₂O emissions, in pounds for the plant. Biogas biomass components are adjusted. For CHP plants, the value is adjusted by the electric allocation factor. This adjusted emissions field is estimated by first making the biomass adjustment (if it exists) and then applying the electric allocation factor (if the plant is a CHP).
- 48. Plant Annual CO₂ Equivalent Emissions (PLCO2EQA) –**
The annual CO₂ equivalent emissions, in short tons, for the plant. This value is a universal standard of measurement. The GWPs from the fourth IPCC assessment are used for the calculation; the formula is as follows:

DESCRIPTION OF DATA ELEMENTS

PLCO2EQA = ((1 * PLCO2AN) + (25 * PLCH4AN / 2000) + (298 * PLN2OAN / 2000)).

49. **Plant Annual Hg Emissions (PLHGAN)** –
Not calculated for eGRID2019.
50. **Plant Annual NO_x Total Output Emission Rate (PLNOXRTA)** –
This field, in lb/MWh, is calculated as follows:
$$\text{PLNOXRTA} = 2000 * (\text{PLNOXAN} / \text{PLNGENAN}).$$
51. **Plant Ozone Season NO_x Total Output Emission Rate (PLNOXRTO)** –
This field, in lb/MWh, is calculated as follows:
$$\text{PLNOXRTO} = 2000 * (\text{PLNOXOZ} / \text{PLNGENOZ}).$$
52. **Plant Annual SO₂ Total Output Emission Rate (PLSO2RTA)** –
This field, in lb/MWh, is calculated as follows:
$$\text{PLSO2RTA} = 2000 * (\text{PLSO2AN} / \text{PLNGENAN}).$$
53. **Plant Annual CO₂ Total Output Emission Rate (PLCO2RTA)** –
This field, in lb/MWh, is calculated as follows:
$$\text{PLCO2RTA} = 2000 * (\text{PLCO2AN} / \text{PLNGENAN}).$$
54. **Plant Annual CH₄ Total Output Emission Rate (PLCH4RTA)** –
This field, in lb/MWh, is calculated as follows:
$$\text{PLCH4RTA} = \text{PLCH4AN} / \text{PLNGENAN}.$$
55. **Plant Annual N₂O Total Output Emission Rate (PLN2ORTA)** –
This field, in lb/MWh, is calculated as follows:
$$\text{PLN2ORTA} = \text{PLN2OAN} / \text{PLNGENAN}$$
56. **Plant Annual CO₂ Equivalent Total Output Emission Rate (PLC2ERTA)** –
This field, in lb/MWh, is calculated as follows:
$$\text{PLC2ERTA} = 2000 * (\text{PLCO2EQA} / \text{PLNGENAN}).$$
57. **Plant Annual Hg Total Output Emission Rate (PLHGRTA)** –
Not calculated for eGRID2019.
58. **Plant Annual NO_x Input Emission Rate (PLNOXRA)** –
This field, in lb/MMBtu, is calculated as follows:
$$\text{PLNOXRA} = 2000 * (\text{PLNOXAN} / \text{PLHTIAN}).$$
59. **Plant Ozone Season NO_x Input Emission Rate (PLNOXRO)** –
This field, in lb/MMBtu, is calculated as follows:
$$\text{PLNOXRO} = 2000 * (\text{PLNOXOZ} / \text{PLHTIOZ}).$$

60. **Plant Annual SO₂ Input Emission Rate (PLSO2RA) –**
This field, in lb/MMBtu, is calculated as follows:
$$\text{PLSO2RA} = 2000 * (\text{PLSO2AN} / \text{PLHTIAN}).$$
61. **Plant Annual CO₂ Input Emission Rate (PLCO2RA) –**
This field, in lb/MMBtu, is calculated as follows:
$$\text{PLCO2RA} = 2000 * (\text{PLCO2AN} / \text{PLHTIAN}).$$
62. **Plant Annual CH₄ Input Emission Rate (PLCH4RA) –**
This field, in lb/MMBtu, is calculated as follows:
$$\text{PLCO2RA} = 2000 * (\text{PLCH4AN} / \text{PLHTIAN}).$$
63. **Plant Annual N₂O Input Emission Rate (PLN2ORA) –**
This field, in lb/MMBtu, is calculated as follows:
$$\text{PLCO2RA} = 2000 * (\text{PLN2OAN} / \text{PLHTIAN}).$$
64. **Plant Annual CO₂ Equivalent Input Emission Rate (PLC2ERA) –**
This field, in lb/MMBtu, is calculated as follows:
$$\text{PLCO2RA} = 2000 * (\text{PLCO2EQA} / \text{PLHTIAN}).$$
65. **Plant Annual Hg Input Emission Rate (PLHGRA) –**
Not calculated for eGRID2019.
66. **Plant Annual NO_x Combustion Output Emission Rate (PLNOXCRT) –**
This field, in lb/MWh, is calculated as follows:
$$\text{PLNOXCRT} = 2000 * (\text{PLNOXAN} / \text{PLGENACY}).$$
67. **Plant Ozone Season NO_x Combustion Output Emission Rate (PLNOXCRO) –**
This field, in lb/MWh, is calculated as follows:
$$\text{PLNOXCRO} = 2000 * (\text{PLNOXOZ} / ((\text{PLGENACY} * \text{PLNGENOZ}) / \text{PLNGENAN})).$$
68. **Plant Annual SO₂ Combustion Output Emission Rate (PLSO2CRT) –**
This field, in lb/MWh, is calculated as follows:
$$\text{PLSO2CRT} = 2000 * (\text{PLSO2AN} / \text{PLGENACY}).$$
69. **Plant Annual CO₂ Combustion Output Emission Rate (PLCO2CRT) –**
This field, in lb/MWh, is calculated as follows:
$$\text{PLCO2CRT} = 2000 * (\text{PLCO2AN} / \text{PLGENACY}).$$
70. **Plant Annual CH₄ Combustion Output Emission Rate (PLCH4CRT) –**
This field, in lb/MWh, is calculated as follows:
$$\text{PLCH4CRT} = \text{PLCH4AN} / \text{PLGENACY}.$$
71. **Plant Annual N₂O Combustion Output Emission Rate (PLN2OCRT) –**
This field, in lb/MWh, is calculated as follows:

PLN2OCRT = PLN2OAN / PLGENACY.

72. **Plant Annual CO₂ Equivalent Combustion Output Emission Rate (PLC2ECRT) –**
This field, in lb/MWh, is calculated as follows:
PLC2ECRT = 2000 * (PLCO2EQA / PLGENACY).
73. **Plant Annual Hg Combustion Output Emission Rate (PLHGCRT) –**
Not calculated for eGRID2019.
74. **Plant Unadjusted Annual NO_x Emissions (UNNOX) –**
The total plant-level unadjusted annual NO_x emissions, in short tons.
75. **Plant Unadjusted Ozone Season NO_x Emissions (UNNOXOZ) –**
The unadjusted five-month ozone season (May through September) NO_x emissions, in short tons, for the plant.
76. **Plant Unadjusted Annual SO₂ Emissions (UNSO2) –**
The total plant-level unadjusted annual SO₂ emissions, in short tons.
77. **Plant Unadjusted Annual CO₂ Emissions (UNCO2) –**
The total plant-level unadjusted annual CO₂ emissions, in short tons.
78. **Plant Unadjusted Annual CH₄ Emissions (UNCH4) –**
The total plant-level unadjusted annual CH₄ emissions, in pounds.
79. **Plant Unadjusted Annual N₂O Emissions (UNN2O) –**
The total plant-level unadjusted annual N₂O emissions, in pounds.
80. **Plant Unadjusted Annual Hg Emissions (UNHG) –**
Not calculated for eGRID2019.
81. **Plant Unadjusted Annual Heat Input from Combustion (UNHTI) –**
The total plant-level unadjusted annual heat input from combustion, in MMBtu.
Sources: EPA/CAMD, EIA-923
82. **Plant Unadjusted Ozone Season Heat Input from Combustion (UNHTIOZ) –**
The five-month ozone season (May through September) heat input from combustion, in MMBtu for the plant.
Sources: EPA/CAMD, EIA-923
83. **Plant Unadjusted Total Annual Heat Input (UNHTIT) –**
The total plant-level unadjusted annual heat input from combustion and noncombustion units, in MMBtu.
Sources: EPA/CAMD, EIA-923
84. **Plant Unadjusted Total Ozone Season Heat Input (UNHTIOZT) –**

The five-month ozone season (May through September) heat input from combustion and noncombustion units, in MMBtu for the plant.

Sources: EPA/CAMD, EIA-923

85. **Plant Unadjusted Annual NO_x Emissions Source (UNNOXSRC)** –
The source of plant-level unadjusted annual NO_x emissions.
86. **Plant Unadjusted Ozone Season NO_x Emissions Source (UNNOZSRC)** –
The source of plant-level unadjusted ozone NO_x emissions.
87. **Plant Unadjusted Annual SO₂ Emissions Source (UNSO2SRC)** –
The source of plant-level unadjusted annual SO₂ emissions.
88. **Plant Unadjusted Annual CO₂ Emissions Source (UNCO2SRC)** –
The source of plant-level unadjusted annual CO₂ emissions.
89. **Plant Unadjusted Annual CH₄ Emissions Source (UNCH4SRC)** –
The source of plant-level unadjusted annual CH₄ emissions.
90. **Plant Unadjusted Annual N₂O Emissions Source (UNN2OSRC)** –
The source of plant-level unadjusted annual N₂O emissions.
91. **Plant Unadjusted Annual Hg Emissions Source (UNHGSRC)** –
Not calculated for eGRID2019.
92. **Plant Unadjusted Annual Heat Input Source (UNHTISRC)** –
The source of plant-level unadjusted annual heat input.
93. **Plant Unadjusted Ozone Season Heat Input Source (UNHOZSRC)** –
The source of plant-level unadjusted ozone season heat input.
94. **Plant Annual NO_x Biomass Emissions (BIONOX)** –
The annual plant-level NO_x biomass emissions, in short tons. This is the value the total emissions are adjusted by for the biomass emissions adjustments. See Section 3.1.2.1 for more information.
Source: EIA-923
95. **Plant Ozone Season NO_x Biomass Emissions (BIONOXOZ)** –
The five-month ozone season (May through September) plant-level NO_x biomass emissions, in short tons. This is the value the total emissions are adjusted by for the biomass emissions adjustments. See Section 3.1.2.1 for more information.
Source: EIA-923
96. **Plant Annual SO₂ Biomass Emissions (BIOSO2)** –
The annual plant-level SO₂ biomass emissions, in short tons. This is the value the total emissions are adjusted by for the biomass emissions adjustments. See Section 3.1.2.1 for more information.
Source: EIA-923

97. **Plant Annual CO₂ Biomass Emissions (BIOCO2) –**
The annual plant-level CO₂ biomass emissions, in short tons. This is the value the total emissions are adjusted by for the biomass emissions adjustments. See Section 3.1.2.1 for more information.
Source: EIA-923
98. **Plant Annual CH₄ Biomass Emissions (BIOCH4) –**
The annual plant-level CH₄ biomass emissions, in pounds. This is the value the total emissions are adjusted by for the biomass emissions adjustments. See Section 3.1.2.1 for more information.
Source: EIA-923
99. **Plant Annual N₂O Biomass Emissions (BION2O) –**
The annual plant-level N₂O biomass emissions, in pounds. This is the value the total emissions are adjusted by for the biomass emissions adjustments. See Section 3.1.2.1 for more information.
Source: EIA-923
100. **Plant Combustion Annual Heat Input CHP Adjustment Value (CHPCHTI) –**
The annual plant-level heat input adjustment value for CHP plants, in MMBtu. See Section 3.1.2.2 for more information.
101. **Plant Combustion Ozone Season Heat Input CHP Adjustment Value (CHPCHTIOZ) –**
The five-month ozone season (May through September) plant-level heat input adjustment value for CHP plants, in MMBtu. See Section 3.1.2.2 for more information.
102. **Plant Annual NO_x Emissions CHP Adjustment Value (CHPNOX) –**
The annual plant-level NO_x emissions adjustment value for CHP plants, in short tons. See Section 3.1.2.2 for more information.
103. **Plant Ozone season NO_x Emissions CHP Adjustment Value (CHPNOXOZ) –**
The five-month ozone season (May through September) plant-level NO_x emissions adjustment value for CHP plants, in short tons. See Section 3.1.2.2 for more information.
104. **Plant Annual SO₂ Emissions CHP Adjustment Value (CHPSO2) –**
The annual plant-level SO₂ emissions adjustment value for CHP plants, in short tons. See Section 3.1.2.2 for more information.
105. **Plant Annual CO₂ Emissions CHP Adjustment Value (CHPCO2) –**
The annual plant-level CO₂ emissions adjustment value for CHP plants, in short tons. See Section 3.1.2.2 for more information.
106. **Plant Annual CH₄ Emissions CHP Adjustment Value (CHPCH4) –**
The annual plant-level CH₄ emissions adjustment value for CHP plants, in pounds. See Section 3.1.2.2 for more information.

- 107. Plant Annual N₂O Emissions CHP Adjustment Value (CHPN2O) –**
The annual plant-level N₂O emissions adjustment value for CHP plants, in pounds. See Section 3.1.2.2 for more information.
- 108. Plant Nominal Heat Rate (PLHTRT) –**
The plant nominal heat rate, in Btu/kWh, for partial combustion plants. It is calculated as follows:
- $$\text{PLHTRT} = 1000 * (\text{PLHTIAN} / \text{PLGENACY})$$
- For CHP plants, the value is, in effect, adjusted by the electric allocation factor, since the heat input has been adjusted.
- 109. Plant Annual Coal Net Generation (PLGENACL) –**
The plant annual net generation, in MWh, for coal. Fuel codes that are included in coal are BIT, COG, SUB, LIG, WC, and SC.
- 110. Plant Annual Oil Net Generation (PLGENAOL) –**
The plant annual net generation, in MWh, for oil. Fuel codes included in oil are DFO, JF, KER, OO, PC, RFO, RG, and WO.
- 111. Plant Annual Gas Net Generation (PLGENAGS) –**
The plant annual net generation, in MWh, for natural gas. Fuel codes included in gas are NG and PG.
- 112. Plant Annual Nuclear Net Generation (PLGENANC) –**
The plant annual net generation, in MWh, for nuclear. The fuel code is NUC.
- 113. Plant Annual Hydro Net Generation (PLGENAHY) –**
The plant annual net generation, in MWh, for hydro. The fuel code is WAT.
- 114. Plant Annual Biomass Net Generation (PLGENABM) –**
The annual net generation, in MWh, for biomass. Biomass is a fuel derived from organic matter such as wood and paper products, agricultural waste, or methane (e.g., from landfills). The renewable portion of solid waste, fuel code MSB, is included as biomass, as are AB, BLQ, DG, LFG, ME, OBL, OBS, PP, SLW, WDL, and WDS.
- 115. Plant Annual Wind Net Generation (PLGENAWI) –**
The plant annual net generation, in MWh, for wind. The fuel code is WND.
- 116. Plant Annual Solar Net Generation (PLGENASO) –**
The plant annual net generation, in MWh, for solar. The fuel code is SUN.
- 117. Plant Annual Geothermal Net Generation (PLGENAGT) –**
The plant annual net generation, in MWh, for geothermal. The fuel code is GEO.
- 118. Plant Annual Other Fossil Net Generation (PLGENAOF) –**

The plant annual net generation, in MWh, for other fossil fuel that cannot be categorized as coal, oil, or gas. Other fossil fuel codes include BFG, COG, HY, LB, MH, MSF, OG, PRG, and TDF.

119. **Plant Annual Other Unknown/Purchased Fuel Net Generation (PLGENAOP)** –
The plant annual net generation, in MWh, for other unknown/purchased. Fuel codes include OTH, PUR, or WH.
120. **Plant Annual Total Nonrenewables Net Generation (PLGENATN)** –
The annual total nonrenewables net generation, in MWh, for the plant.
Nonrenewables are exhaustible energy resources such as coal, oil, gas, other fossil, nuclear power, and other unknown/purchased fuel. This field is the sum of PLGENACL, PLGENAOL, PLGENAGS, PLGENAOF, PLGENANC, and PLGENAOP.
121. **Plant Annual Total Renewables Net Generation (PLGENATR)** –
The annual total renewables net generation, in MWh, for the plant. Renewables are inexhaustible energy resources such as biomass, wind, solar, geothermal, and hydro. This field is the sum of PLGENABM, PLGENAWI, PLGENASO, PLGENAGT, and PLGENAHY.
122. **Plant Annual Total Nonhydro Renewables Net Generation (PLGENATH)** –
The annual total nonhydro renewables net generation, in MWh, for the plant. This field is the sum of PLGENABM, PLGENAWI, PLGENASO, and PLGENAGT.
123. **Plant Annual Total Combustion Net Generation (PLGENACY)** –
The annual total combustion net generation, in MWh, for the plant. This field is the sum of PLGENACL, PLGENAOL, PLGENAGS, PLGENAOF, PLGENABM, and PLGENAOP.
124. **Plant Annual Total Noncombustion Net Generation (PLGENACN)** –
The annual total noncombustion net generation, in MWh, for the plant. This field is the sum of PLGENANC, PLGENAHY, PLGENAWI, PLGENASO, and PLGENAGT.
125. **Plant Coal Generation Percent (PLCLPR)** –
The coal resource mix expressed as a percent of plant annual net generation.
$$PLCLPR = 100 * (PLGENACL / PLNGENAN).$$
126. **Plant Oil Generation Percent (PLOLPR)** –
The oil resource mix expressed as a percent of plant annual net generation.
$$PLOLPR = 100 * (PLGENAOL / PLNGENAN).$$
127. **Plant Gas Generation Percent (PLGSPR)** –
The gas resource mix expressed as a percent of plant annual net generation.
$$PLGSPR = 100 * (PLGENAGS / PLNGENAN).$$

128. **Plant Nuclear Generation Percent (PLNCPR) –**
The nuclear resource mix expressed as a percent of plant annual net generation.
$$\text{PLNCPR} = 100 * (\text{PLGENANC} / \text{PLNGENAN}).$$
129. **Plant Hydro Generation Percent (PLHYPR) –**
The hydro resource mix expressed as a percent of plant annual net generation.
$$\text{PLHYPR} = 100 * (\text{PLGENAHY} / \text{PLNGENAN}).$$
130. **Plant Biomass Generation Percent (PLBMPR) –**
The biomass resource mix expressed as a percent of plant annual net generation.
$$\text{PLBMPR} = 100 * (\text{PLGENABM} / \text{PLNGENAN}).$$
131. **Plant Wind Generation Percent (PLWIPR) –**
The wind resource mix expressed as a percent of plant annual net generation.
$$\text{PLWIPR} = 100 * (\text{PLGENAWI} / \text{PLNGENAN}).$$
132. **Plant Solar Generation Percent (PLSOPR) –**
The solar resource mix expressed as a percent of plant annual net generation.
$$\text{PLSOPR} = 100 * (\text{PLGENASO} / \text{PLNGENAN}).$$
133. **Plant Geothermal Generation Percent (PLGTPR) –**
The geothermal resource mix expressed as a percent of plant annual net generation.
$$\text{PLGTPR} = 100 * (\text{PLGENAGT} / \text{PLNGENAN}).$$
134. **Plant Other Fossil Generation Percent (PLOFPR) –**
The other fossil resource mix expressed as a percent of plant annual net generation.
$$\text{PLOFPR} = 100 * (\text{PLGENAOF} / \text{PLNGENAN}).$$
135. **Plant Other Unknown/Purchased Fuel Generation Percent (PLOPPR) –**
The other unknown/purchased fuel/waste heat resource mix expressed as a percent of plant annual net generation.
$$\text{PLOPPR} = 100 * (\text{PLGENAOP} / \text{PLNGENAN}).$$
136. **Plant Total Nonrenewables Generation Percent (PLTNPR) –**
The total nonrenewables resource mix expressed as a percent of plant annual net generation.
$$\text{PLTNPR} = 100 * (\text{PLGENATN} / \text{PLNGENAN}).$$
137. **Plant Total Renewables Generation Percent (PLTRPR) –**
The total renewables resource mix expressed as a percent of plant annual net generation.
$$\text{PLTRPR} = 100 * (\text{PLGENATR} / \text{PLNGENAN}).$$
138. **Plant Total Nonhydro Renewables Generation Percent (PLTHPR) –**
The total nonhydro renewables resource mix expressed as a percent of plant annual net generation.
$$\text{PLTHPR} = 100 * (\text{PLGENATH} / \text{PLNGENAN}).$$

139. **Plant Total Combustion Generation Percent (PLCYPR)** –
The total combustion resource mix expressed as a percent of plant annual net generation.
$$\text{PLCYPR} = 100 * (\text{PLGENACY} / \text{PLNGENAN}).$$
140. **Plant Total Noncombustion Generation Percent (PLCNPR)** –
The total noncombustion resource mix expressed as a percent of plant annual net generation.
$$\text{PLCNPR} = 100 * (\text{PLGENACN} / \text{PLNGENAN}).$$

5.4 The ST (State) File

There are 164 variables in the fourth file, ST, which contains state level data. All size, heat input, generation, and emission values are derived by aggregating from the plant level based on the state in which the plant is located. Aggregated variable names generally begin with “ST.” Variables that are either identical to those in the plant file or different from those in the plant file by the first two letters of their names (e.g., STHTIAN instead of PLHTIAN) are not re-defined here.

1. **Data Year (YEAR)** –
2. **State Abbreviation (PSTATABB)** –
3. **FIPS State Code (FIPSST)** –
4. **State Nameplate Capacity (STNAMEPCAP)** –
5. **State Annual Heat Input from Combustion (STHTIAN)** –
6. **State Ozone Season Heat Input from Combustion (STHTIOZ)** –
7. **State Total Annual Heat Input (STHTIANT)** –
8. **State Total Ozone Season Heat Input (STHTIOZT)** –
9. **State Annual Net Generation (STNGENAN)** –
10. **State Ozone Season Net Generation (STNGENOZ)** –
11. **State Annual NO_x Emissions (STNOXAN)** –
12. **State Ozone Season NO_x Emissions (STNOXOZ)** –
13. **State Annual SO₂ Emissions (STSO2AN)** –
14. **State Annual CO₂ Emissions (STCO2AN)** –

15. **State Annual CH₄ Emissions (STCH4AN)** –
16. **State Annual N₂O Emissions (STN2OAN)** –
17. **State Annual CO₂ Equivalent Emissions (STCO2EQA)** –
This field, in short tons, is the sum of each state's plants' PLCO2EQA.
18. **State Annual Hg Emissions (STHGAN)** –
19. **State Annual NO_x Total Output Emission Rate (STNOXRTA)** –
This field, in lb/MWh, is calculated as follows:
$$STNOXRTA = 2000 * (STNOXAN / STNGENAN).$$
20. **State Ozone Season NO_x Total Output Emission Rate (STNOXRTO)** –
This field, in lb/MWh, is calculated as follows:
$$STNOXRTO = 2000 * (STNOXOZ / STNGENOZ).$$
21. **State Annual SO₂ Total Output Emission Rate (STSO2RTA)** –
This field, in lb/MWh, is calculated as follows:
$$STSO2RTA = 2000 * (STSO2AN / STNGENAN).$$
22. **State Annual CO₂ Total Output Emission Rate (STCO2RTA)** –
This field, in lb/MWh, is calculated as follows:
$$STCO2RTA = 2000 * (STCO2AN / STNGENAN).$$
23. **State Annual CH₄ Total Output Emission Rate (STCH4RTA)** –
This field, in lb/MWh, is calculated as follows:
$$STHCH4RTA = STCH4AN / STNGENAN.$$
24. **State Annual N₂O Total Output Emission Rate (STN2ORTA)** –
This field, in lb/MWh, is calculated as follows:
$$STN2ORTA = STN2OAN / STNGENAN.$$
25. **State Annual CO₂ Equivalent Total Output Emission Rate (STC2ERTA)** –
This field, in lb/MWh, is calculated as follows:
$$STC2ERTA = 2000 * (STCO2EQA / STNGENAN).$$
26. **State Annual Hg Total Output Emission Rate (STHGRTA)** –
Not calculated for eGRID2019.
27. **State Annual NO_x Input Emission Rate (STNOXRA)** –
This field, in lb/MMBtu, is calculated as follows:
$$STNOXRA = 2000 * (STNOXAN / STHTIAN).$$
28. **State Ozone Season NO_x Input Emission Rate (STNOXRO)** –
This field, in lb/MMBtu, is calculated as follows:
$$STNOXRO = 2000 * (STNOXOZ / STHTIOZ).$$

- 29. State Annual SO₂ Input Emission Rate (STSO2RA) –**
This field, in lb/MMBtu, is calculated as follows:
$$\text{STSO2RA} = 2000 * (\text{STSO2AN} / \text{STHTIAN}).$$
- 30. State Annual CO₂ Input Emission Rate (STCO2RA) –**
This field, in lb/MMBtu, is calculated as follows:
$$\text{STCO2RA} = 2000 * (\text{STCO2AN} / \text{STHTIAN}).$$
- 31. State Annual CH₄ Input Emission Rate (STCH4RA) –**
This field, in lb/MMBtu, is calculated as follows:
$$\text{STCH4RA} = 2000 * (\text{STCH4AN} / \text{STHTIAN}).$$
- 32. State Annual N₂O Input Emission Rate (STN2ORA) –**
This field, in lb/MMBtu, is calculated as follows:
$$\text{STN2ORA} = 2000 * (\text{STN2OAN} / \text{STHTIAN}).$$
- 33. State Annual CO₂ Equivalent Input Emission Rate (STC2ERA) –**
This field, in lb/MMBtu, is calculated as follows:
$$\text{STC2ERA} = 2000 * (\text{STCO2EQA} / \text{STHTIAN}).$$
- 34. State Annual Hg Input Emission Rate (STHGRA) –**
Not calculated for eGRID2019.
- 35. State Annual NO_x Combustion Output Emission Rate (STNOXCRT) –**
This field, in lb/MMBtu, is calculated as follows:
$$\text{STNOXCRT} = 2000 * (\text{STNOXAN} / \text{STGENACY}).$$
- 36. State Ozone Season NO_x Combustion Output Emission Rate (STNOXCRO) –**
This field, in lb/MMBtu, is calculated as follows:
$$\text{STNOXCRO} = 2000 * (\text{STNOXOZ} / ((\text{STGENACY} * \text{STNGENOZ}) / \text{STNGENAN})).$$
- 37. State Annual SO₂ Combustion Output Emission Rate (STSO2CRT) –**
This field, in lb/MMBtu, is calculated as follows:
$$\text{STSO2CRT} = 2000 * (\text{STSO2AN} / \text{STGENACY}).$$
- 38. State Annual CO₂ Combustion Output Emission Rate (STCO2CRT) –**
This field, in lb/MMBtu, is calculated as follows:
$$\text{STCO2CRT} = 2000 * (\text{STCO2AN} / \text{STGENACY}).$$
- 39. State Annual CH₄ Combustion Output Emission Rate (STCH4CRT) –**
This field, in lb/MMBtu, is calculated as follows:
$$\text{STCH4CRT} = \text{STCH4AN} / \text{STGENACY}.$$
- 40. State Annual N₂O Combustion Output Emission Rate (STN2OCRT) –**
This field, in lb/MMBtu, is calculated as follows:
$$\text{STN2OCRT} = \text{STN2OAN} / \text{STGENACY}.$$

- 41. State Annual CO₂ Equivalent Combustion Output Emission Rate (STC2ECRT) –**
This field, in lb/MMBtu, is calculated as follows:
$$\text{STC2ECRT} = 2000 * (\text{STCO2EQA} / \text{STGENACY}).$$
- 42. State Annual Hg Combustion Output Emission Rate (STHGCRT) –**
Not calculated for eGRID2019.
- 43. State Annual NO_x Coal Output Emission Rate (STCNOXRT) –**
The sum of the annual NO_x emissions from all plants in the state that have coal as the primary fuel (PLPRMFL) divided by the sum of the annual combustion net generation from the same set of plants, and multiplied by a unit conversion factor, in lb/MWh.
- 44. State Annual NO_x Oil Output Emission Rate (STONOXRT) –**
The sum of the annual NO_x emissions from all plants in the state that have oil as the primary fuel (PLPRMFL) divided by the sum of the annual combustion net generation from the same set of plants, and multiplied by a unit conversion factor, in lb/MWh.
- 45. State Annual NO_x Gas Output Emission Rate (STGNOXRT) –**
The sum of the annual NO_x emissions from all plants in the state that have natural gas as the primary fuel (PLPRMFL) divided by the sum of the annual combustion net generation from the same set of plants, and multiplied by a unit conversion factor, in lb/MWh.
- 46. State Annual NO_x Fossil Fuel Output Emission Rate (STFSNXRT) –**
The sum of the annual NO_x emissions from all plants in the state that have any fossil fuel (coal, oil, gas, or other fossil) as the primary fuel (PLPRMFL) divided by the sum of the annual combustion net generation from the same set of plants, and multiplied by a unit conversion factor, in lb/MWh.
- 47. - 50. State Ozone Season NO_x Coal, Oil, Gas, and Fossil Fuel Output Emission Rates –**
The descriptions of the ozone season NO_x fields, in lb/MWh, contain the same information as annual NO_x fields #43 through #46, respectively. The state ozone season combustion net generation, used in the denominator of the equations, is calculated as the ratio of the state annual to ozone season net generation for that fuel times the state annual combustion net generation.
- 51. - 54. State Annual SO₂ Coal, Oil, Gas, and Fossil Fuel Output Emission Rates –**
The descriptions of the annual SO₂ fields, in lb/MWh, contain the same information as annual NO_x fields #43 through #46, respectively.

- 55. - State Annual CO₂ Coal, Oil, Gas, and Fossil Fuel Output Emission**
- 58. Rates –**
- The descriptions of annual CO₂ fields, in lb/MWh, contain the same information as annual NO_x fields #43 through #46, respectively.
- 59. - State Annual CH₄ Coal, Oil, Gas, and Fossil Fuel Output Emission**
- 62. Rates –**
- The descriptions of annual CH₄ fields, in lb/MWh, contain the same information as annual NO_x fields #43 through #46, respectively.
- 63. - State Annual N₂O Coal, Oil, Gas, and Fossil Fuel Output Emission**
- 66. Rates –**
- The descriptions of annual N₂O fields, in lb/MWh, contain the same information as annual NO_x fields #43 through #46, respectively.
- 67. - State Annual CO₂ Equivalent Coal, Oil, Gas, and Fossil Fuel Output Emission**
- 70. Rates –**
- The descriptions of annual CO₂ equivalent fields, in lb/MWh, contain the same information as annual NO_x fields #43 through #46, respectively.
- 71. - State Annual Hg Coal, Oil, Gas, and Other Fossil Fuel Output Emission**
- 72. Rates –**
- Not calculated.
- 73. - State Annual NO_x, Ozone Season NO_x, Annual SO₂, Annual CO₂, Annual CH₄, Annual N₂O, Annual CO₂ Equivalent Coal, Oil, Gas, and Fossil Fuel Input Emission Rates; and Annual Hg Coal and Fossil Fuel Input Emission Rates –**
- The descriptions of these fields, primary fuel-specific input emission rates, contain the same information that fields #43 through #46 do for primary fuel-specific output emission rates – except that the calculations include heat input, rather than net generation. These values are calculated in the same manner as the input emission rates, using heat input in place of generation.
- 103. - State Annual NO_x, Ozone Season NO_x, Annual SO₂, Annual CO₂, Annual CH₄, Annual N₂O, Annual CO₂ Equivalent, and Annual Hg Nonbaseload Output Emission Rate –**
- These fields, in lb/MWh, are calculated as the sum of the annual nonbaseload NO_x, ozone season nonbaseload NO_x, annual nonbaseload SO₂, annual nonbaseload CO₂, annual nonbaseload CH₄, annual nonbaseload N₂O, and annual nonbaseload CO₂ equivalent emissions divided by the sum of annual nonbaseload net generation in the state and then multiplied by a unit conversion factor. These fields are intended to provide a more refined estimate of avoided emissions than the fossil-fuel average output emission rate. The nonbaseload emissions and generation include only emissions and generation from combustion sources and exclude emissions and generation from plants that have high capacity factors. The remaining emissions and

generation are weighted by a factor which is a function of capacity factor. For more information, see Section 3.1.3 on emission rate estimates.

111. **State Annual Coal Net Generation (STGENACL) –**
112. **State Annual Oil Net Generation (STGENAOL) –**
113. **State Annual Gas Net Generation (STGENAGS) –**
114. **State Annual Nuclear Net Generation (STGENANC) –**
115. **State Annual Hydro Net Generation (STGENAHY) –**
116. **State Annual Biomass Net Generation (STGENABM) –**
117. **State Annual Wind Net Generation (STGENAWI) –**
118. **State Annual Solar Net Generation (STGENASO) –**
119. **State Annual Geothermal Net Generation (STGENAGT) –**
120. **State Annual Other Fossil Net Generation (STGENAOF) –**
121. **State Annual Other Unknown/Purchased Fuel Net Generation (STGENAOP) –**
122. **State Annual Total Nonrenewables Net Generation (STGENATN) –**

164. State Nonbaseload Other Unknown/Purchased Fuel Generation Percent (STNBOPPR) –

5.5 The BA (Balancing Authority) File

There are 164 variables in the fifth file, BA, which contains location (operator)-based balancing authority data. All generation and emission values are derived by aggregating from the plant level based on the associated balancing authority.

All variables have been described in previous file variable descriptions. Aggregated variable names generally begin with “BA.”

5.6 The SRL (eGRID Subregion) File

There are 164 variables in the sixth file, SRL, which contains location (operator)-based eGRID subregions. All generation and emission values are derived by aggregating from the plant level based on the associated eGRID subregion.

All other variables in the eGRID Subregion file have been described in previous file variable descriptions. Aggregated variable names generally begin with “SR.”

5.7 The NRL (NERC Region) File

There are 164 variables in the seventh file, NRL, which contains location (operator)-based NERC region data. All generation and emission values are derived by aggregating from the plant level based on the associated NERC region.

The only variable in this file that has not been described in a previous file variable description is NERCNAME, the NERC region name associated with the NERC region acronym (see Section 3.4.1). Aggregated variable names generally begin with “NR.”

5.8 The US (U.S.) File

There are 162 variables in the eighth file, US, which contains data for the entire United States. All generation and emission values are derived by aggregating from the plant level. All variables have

been described in previous file variable descriptions. Aggregated variable names generally begin with “US.”

5.9 The Regional Grid Gross Loss File

There are five variables in the GGL file, reported in eGRID at the regional level based on the aforementioned aggregated state level data:

1. **Data Year (YEAR)** –
The current eGRID data year.
2. **REGION**
One of the three interconnect power grids in the U.S.: Eastern, Western, or ERCOT, plus the states of Alaska and Hawaii, and the entire U.S.
3. **Estimated Losses (ESTLOSS)**
The total amount of electricity, in MWh, in the region that is generated but is not sold for resale or wholesale, furnished without charge, or used by the generator or utility; i.e., electricity that is lost in transmission and distribution.
Source: EIA State Electricity Profiles, Supply and disposition of electricity, 1990-2019.
4. **Total Disposition without Exports (TOTDISP)**
The total amount of electricity, in MWh, in the region that is sold directly to customers, sold for resale, furnished without charge, consumed by the respondent without charge, and lost; i.e., all electricity generated, without exports.
Source: EIA State Electricity Profiles, Supply and disposition of electricity, 1990-2019.
5. **Direct Use (DIRCTUSE)**
The total amount of electricity, in MWh, used by plants and/or utilities in the region that is not sold for wholesale or resale; direct use electricity is not transmitted through the grid and therefore does not have the potential to be lost.
Source: EIA State Electricity Profiles, Supply and disposition of electricity, 1990-2019.
6. **Grid Gross Loss (GGRSLOSS)**
The estimated grid gross loss as a percent. The formula used is $[ESTLOSS / (TOTDISP - DIRCTUSE)] * 100$.

The grid gross loss values can be used when applying eGRID GHG factors (eGRID subregion annual GHG total output emission rates) to consumption. Specifically, to account for indirect emissions associated with consumption of electricity (both from generation and from transmission and distribution line losses) divide the product of the electricity consumption and the generation based eGRID total output emission rates by (one minus the grid gross loss as a decimal). See the equation below:

DESCRIPTION OF DATA ELEMENTS

$$\text{GHG emis cons} = \text{GHG emis rate} * \text{Consumption} / (1-\text{ggl\%}/100)/2000$$

Where;

GHG emis cons = a specified GHG emission associated with a certain amount of electricity consumption (generation and line losses) in short tons,

GHG emis rate = eGRID subregion annual total output emission rate in lb/MWh for a specified GHG,

Consumption = the given electricity consumption in MWh (kWh/1000), and
ggl% = the estimated regional grid gross loss as a percent.

If reporting the indirect emissions for the electricity generation (scope 2 emissions) separately from the indirect emissions as a result of transmission and distribution line losses (scope 3 emissions), then the scope 2 emissions are simply the consumption in MWh multiplied by the eGRID subregion annual total output emission rate in lb/MWh, and the scope 3 emissions are calculated in the following equation:

$$\text{GHG emis ll} = \text{GHG emis rate} * \text{Consumption} * (\text{ggl\%}/100) / (1-\text{ggl\%}/100)/2000$$

Where;

GHG emis ll = a specified GHG emission associated with the line losses of a certain amount of electricity consumption in short tons,

GHG emis rate = eGRID subregion annual total output emission rate in lb/MWh for a specified GHG,

Consumption = the given electricity consumption in MWh (= kWh/1000), and
ggl% = the estimated regional grid gross loss as a percent.

Appendix A. eGRID File Structure - Variable Descriptions for eGRID2019

The structure of the nine files – including descriptions of the variables, unit of measurement, and original source(s) of data – are delineated below in the file structure. NOTE: *Italics indicates new field; bold indicates methodological change.* Units in the following tables represent the units in the English unit eGRID2019 workbook.

Table A-1. eGRID File Structure, eGRID2019 UNIT Unit File

Field	Name	Description	Unit	Source(s)
1	SEQUNT19	eGRID2019 file unit sequence number		assigned
2	YEAR	Data year		
3	PSTATABB	Plant state abbreviation		EIA-860
4	PNAME	Plant name		EPA/CAMD
5	ORISPL	DOE/EIA ORIS plant or facility code		EPA/CAMD, EIA-860
6	UNITID	Unit ID		EPA/CAMD, EIA-923
7	PRMVR	Prime Mover		EPA/CAMD, EIA-860
8	UNTOPST	Unit operational status		EPA/CAMD, EIA-860
9	CAMDFLAG	CAMD Program flag		EPA/CAMD
10	PRGCODE	Program code(s)		EPA/CAMD
11	BOTFIFTY	Boiler bottom and firing type		EPA/CAMD, EIA-860
12	NUMGEN	Number of associated generators		EIA-860
13	FUELU1	Unit primary fuel		EPA/CAMD, EIA-923, EIA-860
14	HRSOP	Unit operating hours	hours	EPA/CAMD
15	HTIAN	Unit unadjusted annual heat input	MMBtu	EPA/CAMD, EIA-923
16	HTIOZ	Unit unadjusted ozone season heat input	MMBtu	EPA/CAMD, EIA-923
17	NOXAN	Unit unadjusted annual NO _x emissions	tons	EPA/CAMD, EIA-923
18	NOXOZ	Unit unadjusted ozone season NO _x emissions	tons	EPA/CAMD, EIA-923
19	SO2AN	Unit unadjusted annual SO ₂ emissions	tons	EPA/CAMD
20	CO2AN	Unit unadjusted annual CO ₂ emissions	tons	EPA/CAMD
21	HGAN	Unit unadjusted annual mercury emissions	lbs	EPA/CAMD
22	HTIANSRC	Unit unadjusted annual heat input source		EPA/CAMD, EIA-923
23	HTIOZSRC	Unit unadjusted ozone season heat input source		EPA/CAMD, EIA-923
24	NOXANSRC	Unit unadjusted annual NO _x emissions source		EPA/CAMD, EIA-923
25	NOXOZSRC	Unit unadjusted ozone season NO _x emissions source		EPA/CAMD, EIA-923
26	SO2SRC	Unit unadjusted annual SO ₂ emissions source		EPA/CAMD, EIA-923
27	CO2SRC	Unit unadjusted annual CO ₂ emissions source		EPA/CAMD, EIA-923
28	HGSRC	Unit unadjusted annual mercury emissions source		EPA/CAMD
29	SO2CTLDV	Unit SO ₂ (scrubber) first control device		EPA/CAMD, EIA-860
30	NOXCTLDV	Unit NO _x first control device		EPA/CAMD; EIA-860
31	HGCTLDV	Unit Hg activated carbon injection system flag		EIA-860
32	UNTYRONL	Unit year on-line		EPA/CAMD, EIA-860

Table A-2. eGRID File Structure, eGRID2019 GEN Generator File

Field	Name	Description	Unit	Source(s)
1	SEQGEN19	eGRID2019 file generator sequence number		assigned
2	YEAR	Data year		
3	PSTATABB	Plant state abbreviation		EIA-860
4	PNAME	Plant name		EPA/CAMD; EIA-860
5	ORISPL	DOE/EIA ORIS plant or facility code		EPA/CAMD; EIA-860
6	GENID	Generator ID		EIA-860
7	NUMBLR	Number of associated boilers		EIA-860
8	GENSTAT	Generator status		EIA-860
9	PRMVR	Generator prime mover type		EIA-860
10	FUELG1	Generator primary fuel		EIA-860
11	NAMEPCAP	Generator nameplate capacity	MW	EIA-860
12	CFACT	Generator capacity factor		calculated
13	GENNTAN	Generator annual net generation	MWh	EIA-923
14	GENNTOZ	Generator ozone season net generation	MWh	EIA-923
15	GENERSRC	Generation data source		assigned
16	GENYRONL	Generator year on-line		EIA-860
17	GENYRRET	Generator year retired		EIA-860

Table A-3. eGRID File Structure, eGRID2019 PLNT Plant File

Field	Name	Description	Unit	Source(s)
1	SEQPLT19	eGRID 2019 file plant sequence number		assigned
2	YEAR	Data year		
3	PSTATABB	Plant state abbreviation		EIA-860
4	PNAME	Plant name		EPA/CAMD; EIA-860
5	ORISPL	DOE/EIA ORIS plant or facility code		EPA/CAMD; EIA-860
6	OPRNAME	Plant operator name		EIA-860
7	OPRCODE	Plant operator ID		EIA-860
8	UTLSRVNM	Utility service territory name		EIA-860
9	UTLSRVID	Utility service territory ID		EIA-860
10	SECTOR	Plant-level sector		EIA-860
11	BANAME	Balancing authority name		EIA-860; EIA-861
12	BACODE	Balancing authority ID code		EIA-860; EIA-861
13	NERC	NERC region acronym		EIA-860
14	SUBRGN	eGRID subregion acronym		EPA
15	SRNAME	eGRID subregion name		EPA
16	ISORTO	Plant associated ISO/RTO Territory		EIA-860
17	FIPSST	Plant FIPS state code		US Census
18	FIPSCNTY	Plant FIPS county code		US Census
19	CNTYNAME	Plant county name		EIA-860
20	LAT	Plant latitude		EIA-860
21	LON	Plant longitude		EIA-860
22	NUMUNT	Number of units		EIA-860
23	NUMGEN	Number of generators		EIA-860
24	PLPRMFL	Plant primary fuel		EPA/CAMD; EIA-923
25	PLFUELCT	Plant primary fuel category		assigned
26	COALFLAG	Flag indicating if the plant burned or generated any amount of coal		assigned
27	CAPFAC	Plant capacity factor		calculated
28	NAMEPCAP	Plant nameplate capacity	MW	EIA-860
29	NBFACTOR	Plant nonbaseload factor		calculated
30	RMBMFLAG	Biogas/biomass plant adjustment flag		assigned
31	CHPFLAG	Combined heat and power (CHP) plant adjustment flag		EPA/CAMD; EIA-860
32	USETHRMO	CHP plant useful thermal output	MMBtu	EIA-923 calculated
33	PWRTOHT	CHP plant power to heat ratio		calculated
34	ELCALLOC	CHP plant electric allocation factor		calculated
35	PSFLAG	Plant pumped storage flag		EIA-860
36	PLHTIAN	Plant annual heat input for combustion units	MMBtu	EPA/CAMD; EIA-923
37	PLHTIOZ	Plant ozone season heat input for combustion units	MMBtu	EPA/CAMD; EIA-923
38	PLHTIANT	Plant annual heat input for all units	MMBtu	EPA/CAMD; EIA-923
39	PLHTIOZT	Plant ozone season heat input for all units	MMBtu	EPA/CAMD; EIA-923
40	PLNGENAN	Plant annual net generation	MWh	EIA-923, EPA/CAMD
41	PLNGENOZ	Plant ozone season net generation	MWh	EIA-923, EPA/CAMD
42	PLNOXAN	Plant annual NO _x emissions	tons	EPA/CAMD; calculated
43	PLNOXOZ	Plant ozone season NO _x emissions	tons	EPA/CAMD; calculated
44	PLSO2AN	Plant annual SO ₂ emissions	tons	EPA/CAMD; calculated
45	PLCO2AN	Plant annual CO ₂ emissions	tons	EPA/CAMD; calculated
46	PLCH4AN	Plant annual CH ₄ emissions	lbs	calculated
47	PLN2OAN	Plant annual N ₂ O emissions	lbs	calculated

Field	Name	Description	Unit	Source(s)
48	PLCO2EQA	Plant annual CO ₂ equivalent emissions ((1 * PLCO2AN) + (25 * PLCH4AN/2000) + (298 * PLN2OAN/2000))	tons	calculated
49	PLHGAN	Plant annual Hg emissions	lbs	not calculated
50	PLNOXRTA	Plant annual NO _x total output emission rate	lb/MWh	calculated
51	PLNOXRTO	Plant ozone season NO _x total output emission rate	lb/MWh	calculated
52	PLSO2RTA	Plant annual SO ₂ total output emission rate	lb/MWh	calculated
53	PLCO2RTA	Plant annual CO ₂ total output emission rate	lb/MWh	calculated
54	PLCH4RTA	Plant annual CH ₄ total output emission rate	lb/MWh	calculated
55	PLN2ORTA	Plant annual N ₂ O total output emission rate	lb/MWh	calculated
56	PLC2ERTA	Plant annual CO ₂ equivalent total output emission rate	lb/MWh	calculated
57	PLHGRTA	Plant annual Hg total output emission rate	lb/MWh	not calculated
58	PLNOXRRA	Plant annual NO _x input emission rate	lb/MMBtu	calculated
59	PLNOXRO	Plant ozone season NO _x input emission rate	lb/MMBtu	calculated
60	PLSO2RA	Plant annual SO ₂ input emission rate	lb/MMBtu	calculated
61	PLCO2RA	Plant annual CO ₂ input emission rate	lb/MMBtu	calculated
62	PLCH4RA	Plant annual CH ₄ input emission rate	lb/MMBtu	calculated
63	PLN2ORA	Plant annual N ₂ O input emission rate	lb/MMBtu	calculated
64	PLC2ERA	Plant annual CO ₂ equivalent input emission rate	lb/MMBtu	calculated
65	PLHGRA	Plant annual Hg input emission rate	lb/MMBtu	not calculated
66	PLNOXCRT	Plant annual NO _x combustion output emission rate	lb/MWh	calculated
67	PLNOXCRO	Plant ozone season NO _x combustion output emission rate	lb/MWh	calculated
68	PLSO2CRT	Plant annual SO ₂ combustion output emission rate	lb/MWh	calculated
69	PLCO2CRT	Plant annual CO ₂ combustion output emission rate	lb/MWh	calculated
70	PLCH4CRT	Plant annual CH ₄ combustion output emission rate	lb/MWh	calculated
71	PLN2OCRT	Plant annual N ₂ O combustion output emission rate	lb/MWh	calculated
72	PLC2ECRT	Plant annual CO ₂ equivalent combustion output emission rate	lb/MWh	calculated
73	PLHGCRT	Plant annual Hg combustion output emission rate	lb/MWh	not calculated
74	UNNOX	Plant unadjusted annual NO _x emissions	tons	EPA/CAMD, EIA-923
75	UNNOXOZ	Plant unadjusted ozone season NO _x emissions	tons	EPA/CAMD, EIA-923
76	UNSO2	Plant unadjusted annual SO ₂ emissions	tons	EPA/CAMD, EIA-923

Table A-9. eGRID File Structure, eGRID2019 GGL File, Grid Gross Loss (%) File

Field	Name	Description	Unit	Source(s)
1	YEAR	Data year		
2	REGION	One of the three interconnect power grids in the U.S. (plus Alaska, Hawaii, and the entire U.S.)		
3	ESTLOSS	The total amount of electricity in the region that is generated but is not sold for resale or wholesale, furnished without charge, or used by the generator or utility	MWh	EIA State Electricity Profiles, Supply and disposition of electricity, 1990-2019
4	TOTDISP	The total amount of electricity in the region that is sold directly to customers, sold for resale, furnished without charge, consumed by the respondent without charge, and lost, without exports included	MWh	EIA State Electricity Profiles, Supply and disposition of electricity, 1990-2019
5	DIRCTUSE	The total amount of electricity used by plants and/or utilities in the region that is not sold for wholesale or resale; direct use electricity is not transmitted through the grid and therefore does not have the potential to be lost	MWh	EIA State Electricity Profiles, Supply and disposition of electricity, 1990-2019
6	GGRSLOSS	The estimated regional grid gross loss as a percent [Estimated losses/(Total disposition – Direct use)]*100	%	

Appendix B. eGRID Subregion and NERC Region Representational Maps

Figure B-1. eGRID Subregion Representational Map

This is a representational map; many of the boundaries shown on this map are approximate because they are based on companies, not on strict geographical boundaries.

Figure B-2. NERC Region Representational Map

Source: NERC, 2020

This is a representational map; many of the boundaries shown on this map are approximate because they are based on companies, not on strict geographical boundaries.

Appendix C. Crosswalks and Additional Data Tables

This Appendix contains reference tables used in the development of eGRID2019. These include:

- Emission factors used to estimate emissions (where they are not available from CAMD's Power Sector Emissions Data);
- Biomass fuels used in the plant file biomass emissions adjustment;
- A crosswalk of plant ORISPL IDs that are different between CAMD's Power Sector Emissions Data and EIA data;
- Geothermal emission factors by geotype and pollutant; and
- English to Metric conversion factors.

Emission Factors – NO_x, CO₂, SO₂, CH₄, and N₂O

For more information regarding the emission factors used and the methodology to estimate emissions, please see Section 3.1. Emission factors that have changed in eGRID2019 are represented in **bold** in the table.

Table C-1. eGRID Emission Factors for CO₂, CH₄, and N₂O

English Value	English Unit	Metric Value	Metric Unit
1.10231	short ton	1	metric ton
2.2046	pound (lb)	1	Kilogram (kg)
0.9478	MMBtu	1	Gigajoule (GJ)
0.2778	GJ	1	Megawatt-hour (MWh)

Appendix D. Information on Prior Editions of eGRID

Previous releases of eGRID include the following:

- eGRID1996 was first released in December 1998.
- eGRID1997, with 1996 and 1997 data, was first released in December 1999.
- eGRID1998, with 1998 data, and with 1996 and 1997 data from eGRID97, was released in March and September 2001.
- eGRID2000, with preliminary 2000 data, was first released as Version 1.0 in December 2002 and with 1996-2000 data as Version 2.0 in April 2003 and Version 2.01 in May 2003.
- eGRID2004 Version 1.0, with the year 2004 plant spreadsheet file, was first released in December 2006; Version 2.0, which includes one Excel workbook with an updated plant file, as well as the boiler and generator files for year 2004, was released in early April 2007; and Version 2.1, with the complete set of files – boiler, generator, plant, state, electric generating company (EGC) location (operator)- and owner-based, parent company location (operator)- and owner-based, power control area, eGRID subregion, and North American Electric Reliability Corporation (NERC) region – was released in late April 2007 and updated for typos in May 2007.
- eGRID2005 Version 1.0 was released in October 2008 and Version 1.1 was released in January 2009, both with two Excel workbooks with year 2005 data (plant and aggregation) and one Excel workbook with years 2004 and 2005 data (ImportExport).
- eGRID2007 Version 1.0 was released on February 23, 2011 and Version 1.1 was released May 20, 2011, including three Excel workbooks with year 2007 data as well as data for years 2004 and 2005 (the same as those included in eGRID2007). Import-export data for years 2007, 2005, and 2004 are also included.
- eGRID2009 Version 1.0 with year 2009 data was release on May 10, 2012. This edition also includes year 2007, 2005, and 2004 data from the three previously released editions. Import-export data for years 2009, 2007, 2005, and 2004 are also included.
- eGRID2010 Version 1.0 with year 2010 data was released on February 24, 2014. This edition also includes year 2009, 2007, 2005, and 2004 data from the three previously released editions. Import-export data for years 2010, 2009, 2007, 2005, and 2004 are also included.
- eGRID2012 Version 1.0 with year 2012 data was released on October 8, 2015.
- eGRID2014 Version 1.0 with year 2014 data was released on January 13, 2017 and Version 2.0 was released on February 27, 2017.
- eGRID2016 Version 1.0 with year 2016 data was released on February 15, 2018.
- eGRID2018 Version 1.0 with year 2018 data was released on January 28, 2020 and Version 2.0 was released on March 9, 2020.

Note that the naming convention for eGRID had been changed since the release of eGRID2012 so that the year noted in the title reflects the data year rather than the release year.
